Deploying IP and MPLS QoS for Multiservice Networks John William Evans, Clarence Filsfil, 2010-07-26 QoS short for quality of service is one of the most important goals a network designer or administrator will have Ensuring that the network runs at optimal precision with data remaining accurate traveling fast and to the correct user are the main objectives of QoS The various media that fly across the network including voice video and data have different idiosyncrasies that try the dimensions of the network This malleable network architecture poses an always moving potential problem for the network professional The authors have provided a comprehensive treatise on this subject They have included topics such as traffic engineering capacity planning and admission control This book provides real world case studies of QoS in multiservice networks These case studies remove the mystery behind QoS by illustrating the how what and why of implementing QoS within networks Readers will be able to learn from the successes and failures of these actual working designs and configurations Helps readers understand concepts of IP QoS by presenting clear descriptions of QoS components architectures and protocols Directs readers in the design and deployment of IP QoS networks through fully explained examples of actual working designs Contains real life case studies which focus on implementation

Ahsan Chishti, Shaima Quershi, Ajaz Hussain Mir, 2017-11-07 Document from the year 2016 in the subject Computer Science
Internet New Technologies language English abstract Due to the rapid evolution of Internet as well as services over the
Internet including high bandwidth consuming applications like audio and video streaming it has become need of the day to
enhance the Internet infrastructure for bandwidth efficiency One of the present day biggest challenges of networks is the
audio video transmission in real time Developed by the Internet Engineering Task Force Multiprotocol label Switching MPLS
allows networks to offer several services on the single network architecture with improved forwarding speed of routers by
solving the problem of longest prefix match in IP networks Internet Protocol datagram encapsulates payload received from
above layer and adds to its own header information Thus each protocol layer adds its own header with the information
related to the layer This is a disadvantage of a bigger packet header size such as IPv4 UDP RTP header of 40 bytes compared
to the payload size which leads to excessive overhead in case of real time multimedia applications Bandwidth can be
conserved by reducing the amount of redundant IP header transmitted with every packet for the same packet stream through
header compression techniques The header compression mechanisms have several shortcomings such as a problem that
they work on hop by hop basis The packet is compressed by the compressor and decompressed by the decompressor and for
header compression to work these are connected directly not through any intermediate node not even a layer 3 device such
as a router In addition to this there is a limit in the number of compressed flows that a router can take The objective of this
book is to propose header compression technology which can be implemented over MPLS and used as a bandwidth
conserving technology This will solve the problems of hop by hop compression decompression as the compression of packets
is not hop by hop rather the compression is per Label Switched Path LSP of MPLS network from ingress to egress Label
Switched Routers This will also handle packet reordering in addition to allowing numerous flows at the same time The
current work in the area both standardized as well as ongoing research has been discussed in detail and also the problems
that are yet to be addressed are examined This approach also increases the bandwidth efficiency as well as processing
scalability with respect to the maximum number of simultaneous flows *Telecommunications*, 2007 **NEC Research &
