*Classical Analogies in the Solution of Quantum Many-Body Problems* Aydın Cem Keser,2018-11-07 This book addresses problems in three main developments in modern condensed matter physics namely topological superconductivity many body localization and strongly interacting condensates superfluids by employing fruitful analogies from classical mechanics This strategy has led to tangible results firstly in superconducting nanowires the density of states a smoking gun for the long sought Majorana zero mode is calculated effortlessly by mapping the problem to a textbook level classical point particle problem Secondly in localization theory even the simplest toy models that exhibit many body localization are mathematically cumbersome and results rely on simulations that are limited by computational power In this book an alternative viewpoint is developed by describing many body localization in terms of quantum rotors that have incommensurate rotation frequencies an exactly solvable system Finally the fluctuations in a strongly interacting Bose condensate and superfluid a notoriously difficult system to analyze from first principles are shown to mimic stochastic fluctuations of space time due to quantum fields This analogy not only allows for the computation of physical properties of the fluctuations in an elegant way it sheds light on the nature of space time The book will be a valuable contribution for its unifying style that illuminates conceptually challenging developments in condensed matter physics and its use of elegant mathematical models in addition to producing new and concrete results

**Special Topics in Structural Dynamics & Experimental Techniques, Volume 5** David S. Epp,2021-09-14 Dynamics of Coupled Structures Volume 5 Proceedings of the 39th IMAC A Conference and Exposition on Structural Dynamics 2021 the fourth volume of nine from the Conference brings together contributions to this important area of research and engineering The collection presents early findings and case studies on fundamental and applied aspects of the Dynamics of Coupled Structures including papers on Methods for Dynamic Substructures Applications for Dynamic Substructures Interfaces Substructuring Frequency Based Substructuring Transfer Path Analysis

*Computational Modeling and Visualization of Physical Systems with Python* Jay Wang,2015-12-21 Computational Modeling by Jay Wang introduces computational modeling and visualization of physical systems that are commonly found in physics and related areas The authors begin with a framework that integrates model building algorithm development and data visualization for problem solving via scientific computing Through carefully selected problems methods and projects the reader is guided to learning and discovery by actively doing rather than just knowing physics

[Solved Problems in Classical Mechanics](#) O. L. de Lange,J. Pierrus,2010-05-06 Apart from an introductory chapter giving a brief summary of Newtonian and Lagrangian mechanics this book consists entirely of questions and solutions on topics in classical mechanics that will be encountered in undergraduate and graduate courses These include one two and three dimensional motion linear and nonlinear oscillations energy potentials momentum and angular momentum

spherically symmetric potentials multi particle systems rigid bodies translation and rotation of the reference frame the relativity principle and some of its consequences The solutions are followed by a set of comments intended to stimulate inductive reasoning and provide additional information of interest Both analytical and numerical computer techniques are used to obtain and analyze solutions The computer calculations use Mathematica version 7 and the relevant code is given in the text It includes use of the interactive Manipulate function which enables one to observe simulated motion on a computer screen and to study the effects of changing parameters The book will be useful to students and lecturers in undergraduate and graduate courses on classical mechanics and students and lecturers in courses in computational physics

**Mathematical Models for Suspension Bridges** Filippo Gazzola,2015-05-29 This work provides a detailed and up to the minute survey of the various stability problems that can affect suspension bridges In order to deduce some experimental data and rules on the behavior of suspension bridges a number of historical events are first described in the course of which several questions concerning their stability naturally arise The book then surveys conventional mathematical models for suspension bridges and suggests new nonlinear alternatives which can potentially supply answers to some stability questions New explanations are also provided based on the nonlinear structural behavior of bridges All the models and responses presented in the book employ the theory of differential equations and dynamical systems in the broader sense demonstrating that methods from nonlinear analysis can allow us to determine the thresholds of instability
