This course is the second in the two-semester sequence PHY 161/162 General Physics III, a calculus-based introduction to physics. The main themes in this course are waves, electricity and magnetism, and optics. The course contains both lecture and lab components that will help students learn to think scientifically about the physical world. Following a brief introduction we will consider a series of topics: **Oscillations, Waves, Electric Charges, Electric Fields, Gauss' Law, Electric Potentials, Capacitance, Current and resistance, Circuits, Magnetic Fields, Sources of Magnetic Fields, Induction and Optics.** This course is intended primarily for physics, chemistry, math, and engineering majors, but is also recommended for others with good mathematical aptitude, including pre-med students and life sciences majors. Students must already have a working knowledge of geometry, algebra, trigonometry and calculus. The course **MAT 192 Calculus II** is co-requisite: Students must be concurrently enrolled or have equivalent prior academic credit.

Nature behaves in predictable ways which scientists, over hundreds of years, have formulated into a set of basic physical laws. In the lecture portion of this course, students will learn some of these laws and use them to analyze systems mathematically, reach qualitative conclusions, and compute accurately numerical answers to specific questions. Although we will cover a number of topics and physical systems, the students' goal should be to learn to think about nature broadly, and solve problems by specific application of general principles, as physicists do.

The ultimate validity of these natural laws always rests on experimental evidence. In the lab portion of this course we will illustrate, by experiment, a portion of those laws describing the behavior of simple mechanical, optical, and electromagnetic systems. In the process, students will gain basic concepts and procedures of physics laboratory work. They will become familiar with simple experimental apparatus and construct simple devices; measure quantities such as length, frequency, current, voltage, capacitance; compute derived quantities from the data, and perform basic statistical analysis of the data and the derived quantities; and reason from this analysis to answer questions and arrive at logically sound conclusions about the physical world. This process will help them to master the concepts introduced in the lectures, by showing them in action in the laboratory setting. Although we will investigate a number of specific physical systems, students' goal should be to learn to think about nature and perform experiments as physicists do.
