Logical and Relational Learning Luc De Raedt, 2008-09-27 I use the term logical and relational learning to refer to the subfield of artificial intelligence machine learning and data mining that is concerned with learning in expressive logical or relational representations It is the union of inductive logic programming statistical relational learning and multi relational data mining which all have contributed techniques for learning from data in relational form Even though some early contributions to logical and relational learning are about forty years old now it was only with the advent of inductive logic programming in the early 1990s that the field became popular Whereas initial work was often concerned with logical or logic programming issues the focus has rapidly changed to the discovery of new and interpretable knowledge from structured data often in the form of rules

and soon important successes in applications in domains such as bio and cheminformatics and computational linguistics were realized Today the challenges and opportunities of dealing with structured data and knowledge have been taken up by the artificial intelligence community at large and form the motivation for a lot of ongoing research Indeed graph network and multi-relational data mining are now popular themes in data mining and statistical relational learning is receiving a lot of attention in the machine learning and uncertainty in artificial intelligence communities In addition the range of tasks for which logical and relational techniques have been developed now covers almost all machine learning and data mining tasks
