The book starts with an introduction to the basic concepts of structural analysis including the types of structures, loads, and support conditions. It then covers the analysis of statically determinate structures such as beams, trusses, and frames using various methods such as the method of joints, method of sections, and moment distribution method. The book also covers the analysis of statically indeterminate structures including the use of the force method and displacement method. It includes a detailed discussion of the influence lines for determinate and indeterminate structures as well as the analysis of continuous beams and frames. Other topics covered in the book include the analysis of shear and moment diagrams, deflection of beams and frames, and the analysis of cables and arches. The book also includes numerous examples and exercises to help students understand the concepts and apply them to real-world problems.
