## The Transportation Planning Process

### 11-1

**Explain why the transportation planning process is not intended to furnish a decision or give a single result.**

The transportation planning process is a rational one that intends to furnish unbiased information about the effects that proposed transportation projects will have on the community, its environmental impacts, and its expected users. This process is not intended to furnish or to give a single result that must be followed but to provide information to the general public and to the political bodies responsible for deciding whether proposed transportation projects should be developed.

### 11-2

**Describe the steps that an engineer must follow if asked to determine the need for a grade-separated railroad grade crossing that would replace an at-grade crossing of a two-lane highway with a rail line.**

The first step the engineer will need to follow is to define the situation. The engineer must fully understand the reason why the grade-separated structure is said to be needed.

The next step is to define the problem in terms of the objectives to be accomplished by the project. The objectives for this project might be to improve safety by reducing or eliminating vehicle-train interaction. Another quantifiable objective might include the reduction in travel time to the motorists by eliminating delay due to crossing trains.

The third step for the engineer is to identify solutions to the perceived problem. Possible solutions to the problem might include the installation of active warning devices at the grade crossing, the diversion of motorists to other close-by grade crossings, or to construct a grade separated structure. A "no-build" or "do-nothing" alternative is typically considered as a possible solution.

The fourth step in the process is to analyze the expected performance of each of the alternatives under present and future conditions. This analysis should employ quantified measures of effectiveness such as travel time delay reductions and crash rate reductions. The analysis should also take into consideration costs such as the construction, maintenance, and operation costs of each alternative.

The fifth step in the process is to compare the alternatives against the objectives developed in step 2 of this process. The advantages and disadvantages of each must be studied.
