

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These gaskets have a gasket seat or groove seat. They are a gasket with an application on all three and high compressions used to increase the quality. A gasket is used to maintain the pressure in a cylinder and to prevent it from leaking through the top of the cylinder. The gasket compresses the two components between the mating surfaces of the cylinder. This is done by creating a seal between the gasket and the two components between the mating surfaces. If the gasket seating surface is not flat and smooth, the gasket will not seal properly. The gasket will be used for several applications.

In order to determine the application, the gasket design is essential. The gasket design is essential to determine the gasket design. Every gasket application is unique and every application requires that the gasket be selected to ensure the performance of the gasket in the application.
