

Additional Exercises for *Convex Optimization*

Stephen Boyd

Lieven Vandenberghe

December 28, 2024

This is a collection of additional exercises, meant to supplement those found in the book *Convex Optimization*, by Stephen Boyd and Lieven Vandenberghe. These exercises were used in several courses on convex optimization, EE364a (Stanford), EE236b (UCLA), or 6.975 (MIT), usually for homework, but sometimes as exam questions. Some of the exercises were originally written for the book, but didn't make the final cut.

Many of the exercises include a computational component using one of the software packages for convex optimization: CVXPY (Python), Convex.jl (Julia), CVX (Matlab), or CVXR (R). We refer to these collectively as CVX*. The files required for these exercises can be found at https://github.com/cvxgrp/cvxbook_additional_exercises. From 2023 on, new problems use Python only.

You are free to use these exercises any way you like (for example in a course you teach), provided you acknowledge the source. In turn, we gratefully acknowledge the teaching assistants (and in some cases, students) who have helped us develop and debug these exercises. Pablo Parrilo helped develop some of the exercises that were originally used in MIT 6.975. Sanjay Lall and John Duchi developed some other problems when they taught EE364a, and the instructors of EE364a during summer quarters developed others.

We'll update this document as new exercises become available, so the exercise numbers and sections will occasionally change. We have categorized the exercises into sections that follow the book chapters, as well as various additional application areas. Some exercises fit into more than one section, or don't fit well into any section, so we have just arbitrarily assigned these.

Course instructors can obtain solutions to these exercises by email to us. Please tell us the course you are teaching and give its URL.

Numerical Computing with IEEE Floating Point Arithmetic Michael L. Overton, 2025-05-29 This book provides an easily accessible yet detailed discussion of computer arithmetic as mandated by the IEEE 754 floating point standard arguably the most important standard in the computer industry The result of an unprecedented cooperation between academic computer scientists and industry the standard is supported by virtually every modern computer Although the basic principles of IEEE floating point arithmetic have remained largely unchanged since the first edition of this book was published in 2001 the technology that supports it has changed enormously Every chapter has been extensively rewritten and two new chapters have been added one on computations with higher precision than that mandated by the standard needed for a variety of scientific applications and one on computations with lower precision than was ever contemplated by those who wrote the standard driven by the massive computational demands of machine learning The second edition of Numerical Computing with IEEE Floating Point Arithmetic includes many technical details not readily available elsewhere along with many new exercises It explores the rationale for floating point representation correctly rounded arithmetic exception handling and support for the standard provided by floating point microprocessors and programming languages Key concepts such as cancellation conditioning and stability are also discussed The book emphasizes historical development from the early history of computing through the 2008 and 2019 revisions of the floating point standard to the latest advances in microprocessor support It also includes a previously unpublished letter by Donald E Knuth on the value of gradual underflow a key requirement of the standard This book should be accessible to any reader with an interest in computers and mathematics including students at all levels Some basic knowledge of calculus and programming is assumed in the second half There is enough variety of content that all but the most expert readers will find something of interest
