OpenLDAP Server Configuration on CentOS 7

OpenLDAP is an open-source implementation of Lightweight Directory Access Protocol developed by OpenLDAP project. LDAP is an Internet protocol that email and other programs use to look up contact information from a server. It is released under OpenLDAP public license; it is available for all major Linux distributions, AIX, Android, HP-UX, OS X, Solaris, Windows and z/OS.

It functions like a relational database in certain ways and can be used to store any information. LDAP is not limited to store the information; it is also used as a backend database for "single sign-on" where one password for a user is shared between many services.

In this tutorial, we will configure OpenLDAP for centralized login where the users use the single account to log in on multiple servers.
