

GEOMETRY - Part 1

segments, lines, planes, geometric formulas

GEOMETRY HISTORY

Geometry means earth measurement. Early people used their basic knowledge of geometry to build roads, bridges, pyramids, and irrigation systems. The more formal study of geometry today is based on an interest in logical reasoning and mathematics rather than measurement alone. Euclid (c.300 B.C.), a legendary Greek geometer, was a brilliant volunteer set of books named **The Elements**, in which the geometric relationships were derived through deductive reasoning. Thus, the formal geometry studied today is often called **Euclidean geometry**. This geometry is also called **plane geometry** because the relationships deal with flat surfaces. Geometry has useful real terms, defined terms, postulates (statements that have not been proved, but have "worked" for thousands of years), and theorems (relationships that have been mathematically and logically proven).

GEOMETRIC FORMULAS

Perimeter: The perimeter, P , of a two-dimensional shape is the sum of all side lengths. Area: The area, A , of a two-dimensional shape is the number of square units that can be put in the shape enclosed by the sides. **Area:** Area is obtained through some combination of multiplying lengths and bases, adding halves, times 20° angles will work, except in circles. **Volume:** The volume, V , of a three-dimensional object is the number of cubic units that can be put in the object enclosed by all the sides.

Square Area:
 An s , if $s = 4$ and both sides are all sides are equal in a square, then Area = square units.

Rectangle Area:
 An l , or b , and w , if $l = 4$ and $w = 2$ then Area = $l \times w = 8$, or $4 \times 2 = 8$ square units.

Triangle Area:
 An l , or b , and h , if $l = 4$ and $h = 2$ then Area = $\frac{1}{2}bh = 4$, or $\frac{1}{2} \times 4 \times 2 = 4$ square units.

Parallelogram Area:
 An l , or b , and h , if $l = 4$ and $h = 2$ then Area = $l \times h = 8$, or $4 \times 2 = 8$ square units.

Trapezoid Area:
 An l_1 , l_2 , h , if $l_1 = 4$, $l_2 = 2$, and $h = 2$ then Area = $\frac{1}{2}(l_1 + l_2)h = 6$, or $\frac{1}{2}(4 + 2) \times 2 = 6$ square units.

Circle Area:
 An r , if $r = 1$ and $r = 1$ then Area = $\pi r^2 = \pi$, or $\pi \times 1^2 = \pi$ square units.
 Circumference: $C = 2\pi r$, if $r = 1$ and $r = 1$ then $C = 2\pi$.

Pythagorean Theorem:
 If a right triangle has legs a and b , and hypotenuse c , then $a^2 + b^2 = c^2$.

Rectangle Prism Volume:
 Width w , l , and h , if $w = 2$, $l = 4$, and $h = 2$ then $V = lwh = 16$, or $2 \times 4 \times 2 = 16$ cubic units.

Cube Volume:
 An s , each edge length, if $s = 2$ and $s = 2$ then $V = s^3 = 8$, or $2 \times 2 \times 2 = 8$ cubic units.

Cylinder Volume:
 An r , h , if $r = 1$ and $h = 2$ then $V = \pi r^2 h = 2\pi$, or $\pi \times 1^2 \times 2 = 2\pi$ cubic units.

Cone Volume:
 An r , h , if $r = 1$ and $h = 2$ then $V = \frac{1}{3}\pi r^2 h = \frac{2}{3}\pi$, or $\frac{1}{3} \times \pi \times 1^2 \times 2 = \frac{2}{3}\pi$ cubic units.

Triangular Prism Volume:
 An l , l_1 , l_2 , h , if $l_1 = 4$, $l_2 = 2$, and $h = 2$ then $V = \frac{1}{2}l_1 l_2 h = 8$, or $\frac{1}{2} \times 4 \times 2 \times 2 = 8$ cubic units.

Rectangular Pyramid Volume:
 An l , l_1 , l_2 , h , if $l_1 = 4$, $l_2 = 2$, and $h = 2$ then $V = \frac{1}{3}l l_1 l_2 h = \frac{16}{3}$, or $\frac{1}{3} \times 4 \times 2 \times 2 = \frac{16}{3}$ cubic units.

Sphere Volume:
 An r , if $r = 1$ then $V = \frac{4}{3}\pi r^3 = \frac{4}{3}\pi$, or $\frac{4}{3} \times \pi \times 1^3 = \frac{4}{3}\pi$ cubic units.

DESCRIPTIONS OF UNDEFINED TERMS

Point

- A point may be described as a location with no length, no width, and no depth.
- A point is a letter named with a capital letter. It is usually located by writing a dot above the name of a point, although the points cannot really be drawn because they have no dimensions. (See Examples 1, 2, and 3 on page 4.)

Line

- A line may be described as a set of points going straight on forever in two opposite directions. Lines are straight and uncurved. There is no end to a line or the phrase "straight line" because lines are straight. If something is not straight it cannot be a line. Lines are always curveless. Lines have length, but no width and no depth. Lines cannot be bent or curved. They have length and depth. Experimental lines are drawn on flat surfaces as straight and indicate that the line has no end.
- Lines are usually named by one or two letters. The line containing points K and N may be named by either:
 - Using only the 1-letter name, then these points on the line with a line indicator above the points. For example, \overleftrightarrow{KN} or \overleftrightarrow{NK} (the order of the letters doesn't matter); the line indicator above the capital letters always points horizontally from left to right and never in any other direction. It is the usual direction of the points in space that determines the location and direction of the real line, not the direction of the line indicator above the capital letters on the name.
 - By using the letters with capital letters with a number subscript. For example, ℓ_1 or ℓ_2 .

For example, \overleftrightarrow{KN} or \overleftrightarrow{NK} (the order of the letters doesn't matter); the line indicator above the capital letters always points horizontally from left to right and never in any other direction. It is the usual direction of the points in space that determines the location and direction of the real line, not the direction of the line indicator above the capital letters on the name.

C: These are Euclidean geometry; points and the geometry of lines and planes, and geometric properties of lines and the relationships. See Algebra - Part 2.

Planes

- A plane may be described as a set of points going on forever in all directions except for a flat line that curves depth, meaning the very surface of a perfectly flat piece of paper extending on forever in every direction but having no thickness at all. This could be a flat structure such that when any two points in this plane are connected by a line, all points on the line are also in the plane. Planes have length and width, but no depth.
- Planes are usually referred to as "plane ℓ " or "plane ABC" (any 3 points on the plane that are not on the same line) or "the plane containing \dots " (whatever points in the description). Planes cannot be drawn. Representations of planes are usually drawn as parallelograms, either with the arrows indicating that the planes go on forever or without the arrows even though the points do go on forever.

Postulates

Postulates are statements that have been used and accepted for centuries without formal proof. These are postulates:

- A line contains at least 2 points, and any 2 points locate exactly one line.

- A plane contains at least 3 points that are not all on the same line, and any 3 points that are not on the same line locate exactly one plane. Therefore, a line and one point not on the line also locate exactly one plane.

C: Any 3 points locate at least one plane.

Two planes sharing 3 points are not coincident lines.

Two planes that share 3 points are on the same line.

- Two points of a line are in a plane, then the line is in the plane, or: If two points are in a plane then the line containing the two points is also in the plane.

Two points, K and N, are in the plane, so the line containing them is also in the plane.

Two points, K and N, are not in the plane, so the line containing them is not in the plane.

- Two planes intersect, then their intersection is a line.

Two planes intersect in a line.

DEFINED TERMS

There are many defined terms of plane geometry. The definitions of these terms will be given by name, groups throughout the study guide rather than grouped by one big list.

Plane: Planes are defined as relationships and structures that have meaning for geometry and are useful in other fields, such as physics. Planes are relationships and structures that have been proven mathematically. Postulates and theorems are used throughout the study of geometry. Sometimes they are called axioms or postulates, and sometimes they are simply named and not labeled.

Space

Space is the set of all points. Space goes on forever in every direction, with infinite length, width, and depth. Space has no special location. It is simply defined as space. Space contains at least 4 points that are not all on the same plane.

General Terms

- Two adjacent shapes on the same edge of a polygon are adjacent. After some movement of the shapes they can be made to fit exactly on top of each other.
- Two corresponding parts of adjacent polygons are adjacent. That is, one of the polygons has one side shared with the other polygon, then the parts that match correspondingly are adjacent.
