**Embedded Systems Design using the MSP430FR2355 LaunchPad™** Brock J. LaMeres, 2023-01-06. This textbook for courses in Embedded Systems introduces students to necessary concepts through a hands-on approach: LEARN BY EXAMPLE. This book is designed to teach the material the way it is learned through example. Every concept is supported by numerous programming examples that provide the reader with a step-by-step explanation for how and why the computer is doing what it is doing: LEARN BY DOING. This book targets the Texas Instruments MSP430 microcontroller. This platform is a widely popular, low-cost embedded system that is used to illustrate each concept in the book. The book is designed for a reader that is at their computer with an MSP430FR2355 LaunchPad™ Development Kit plugged in so that each example can be coded and run as they learn: LEARN BOTH ASSEMBLY AND C. The book teaches the basic operation of an embedded computer using assembly language so that the computer operation can be explored at a low level. Once more complicated systems are introduced, i.e., timers, analog-to-digital converters, and serial interfaces, the book moves into the C programming language. Moving to C allows the learner to abstract the operation of the lower-level hardware and focus on understanding how to make things work: BASED ON SOUND PEDAGOGY. This book is designed with learning outcomes and assessment at its core. Each section addresses a specific learning outcome that the student should be able to do after its completion. The concept checks and exercise problems provide a rich set of assessment tools to measure student performance on each outcome.

*From Specification to Embedded Systems Application* Achim Rettberg, Mauro C. Zanella, Franz J. Rammig, 2005-09-28. As almost no other technology, embedded systems are an essential element of many innovations in automotive engineering. New functions and improvements of already existing functions, as well as the compliance with traffic regulations and customer requirements, have only become possible by the increasing use of electronic systems, especially in the fields of driving safety, reliability, and functionality. Along with the functionalities that increase in number and have to cooperate, the complexity of the entire system will increase. Synergy effects resulting from distributed application functionalities via several electronic control devices exchanging information through the network bring about more complex system architectures with many different sub-networks operating with different velocities and different protocol implementations. To manage the increasing complexity of these systems, a deterministic behaviour of the control units and the communication network must be provided for, in particular when dealing with a distributed functionality. *From Specification to Embedded Systems Application* documents recent approaches and results presented at the International Embedded Systems Symposium IESS 2005, which was held in August 2005 in Manaus, Brazil, and sponsored by the International Federation for Information Processing (IFIP). The

topics which have been chosen for this working conference are very timely design methodology modeling specification software synthesis power management formal verification testing network communication systems distributed control systems resource management and special aspects in system design
