so as to make active use of its hardware components. This turns a machine into an autonomous robot. Since about the mid-nineties of the past century, robot programming has made impressive progress. State-of-the-art robots are able to orient themselves and move around freely in indoor environments or negotiate difficult outdoor terrains; they can use stereo vision to recognize objects and they are capable of simple object manipulation with the help of artificial extremities. At a time where robots perform these tasks more and more reliably, we are ready to pursue the next big step, which is to turn autonomous machines into reasoning robots. A reasoning robot exhibits higher cognitive capabilities like following complex and long-term strategies, making rational decisions on a high level, drawing logical conclusions from sensor information acquired over time, devising suitable plans, and reacting sensibly in unexpected situations. All of these capabilities are characteristics of human-like intelligence and ultimately distinguish truly intelligent robots from mere autonomous machines.
