

The Statistics of Inheritance

How can statistics help predict the traits of offspring?

Why?

The randomization of alleles from the parents' genetic material is essential to the survival and evolution of a species. If the combinations of alleles that make up the genetic material in a zygote are truly random, the laws of statistics can be used to predict what traits the offspring will have. This activity starts with a review of Punnett squares, which is one way to make predictions about simple allele combinations. Statistics will then be used to make mathematical predictions about the genotypes of offspring.

Model 1 – Punnett Squares

1. Consider the beetle species in Model 1.
 - a. How many phenotypes for exoskeleton color are exhibited in the population?
There are 2 phenotypes, black and white, for exoskeleton color exhibited in the population.
 - b. How many genotypes for exoskeleton color are exhibited in the population?
There are 3 genotypes, BB, Bb, bb, for exoskeleton exhibited in the population.
2. According to Model 1, which allele, B or b, is the dominant exoskeleton color allele? Justify your answer with specific evidence from Model 1.

According to Model 1, the allele B is the dominant exoskeleton color allele as it is denoted with a capital letter. And, the Punnett Squares show how B-dominated the outcome of the population when there is a dominant allele, B.

Theoretical and Computational Methods in Genome Research Sándor Suhai,2012-12-06 The application ofcomputational methods to solve scientific and practical problems in genome research created a new interdisciplinary area that transcends boundaries tradi tionally separating genetics biology mathematics physics and computer science Com puters have of course been intensively used in the field of life sciences for many years even before genome research started to store and analyze DNA or protein sequences to explore and model the three dimensional structure the dynamics and the function of biopolymers to compute genetic linkage or evolutionary processes

and more The rapid development of new molecular and genetic technologies combined with ambitious goals to explore the structure and function of genomes of higher organisms has generated how ever not only a huge and exponentially increasing body of data but also a new class of scientific questions The nature and complexity of these questions will also require beyond establishing a new kind of alliance between experimental and theoretical disciplines the development of new generations both in computer software and hardware technologies New theoretical procedures combined with powerful computational facilities will substantially extend the horizon of problems that genome research can attack with success Many of us still feel that computational models rationalizing experimental findings in genome research fulfill their promises more slowly than desired There is also an uncertainty concerning the real position of a theoretical genome research in the network of established disciplines integrating their efforts in this field
