Solid-State-Drives (SSDs) Modeling Rino Micheloni,2017-03-28 This book introduces simulation tools and strategies for complex systems of solid state drives SSDs which consist of a flash multi core microcontroller plus NAND flash memories It provides a broad overview of the most popular simulation tools with special focus on open source solutions VSSIM NANDFlashSim and DiskSim are benchmarked against performances of real SSDs under different traffic workloads PROs and CONs of each simulator are analyzed and it is clearly indicated which kind of answers each of them can give and at a what price It is explained that speed and precision do not go hand in hand and it is important to understand when to simulate what and with which tool Being able to simulate SSD s performances is mandatory to meet time to market together with product cost and quality Over the last few years the authors developed an advanced simulator named SSDExplorer which has been used to evaluate multiple phenomena with great accuracy from QoS Quality Of Service to Read Retry from LDPC Soft Information to power from Flash aging to FTL SSD simulators are also addressed in a broader context in this book i e the analysis of what happens when SSDs are connected to the OS Operating System and to the end user application for example a database search The authors walk the reader through the full simulation flow of a real system level by combining SSD Explorer with the QEMU virtual platform The reader will be impressed by the level of know how and the combination of models that such simulations are asking for

Improving Performance of Solid State Drives in Enterprise Environment Jian Hu,2012 Flash memory in the form of Solid State Drive SSD is being increasingly employed in mobile and enterprise level storage systems due to its superior features such as high energy efficiency high random read performance and small form factor However SSD suffers from the erase before write and endurance problems which limit the direct deployment of SSD in enterprise environment Existing studies either develop SSD friendly on board buffer management algorithms or design sophisticated Flash Translation Layers FTL to ease the erase before write problem This dissertation addresses the two issues and consists of two parts The first part focuses on the white box approaches that optimize the internal design of SSD We design a write buffer management algorithm on top of the log block FTL which not only optimizes the write buffer effect by exploiting both the recency and frequency of blocks in the write buffer but also minimizes the destaging overhead by maximizing the number of valid pages of the destaged block We further identify that the low garbage collection efficiency problem has a significantly negative impact to the performance of the page mapped SSD We design a GC Aware RAM management algorithm that improves the GC efficiency even if the workloads do not have

updating requests by dynamically evaluating the benefits of different destaging policies and adaptively adopting the best one. Moreover, this algorithm minimizes the address translation overhead by exploiting the interplay between the buffer component and the FTL component. The second part focuses on the black box approaches that optimize the SSD performance externally. As an increasing number of applications deploy SSD in enterprise environment, understanding the performance characteristics of SSD in enterprise environment is becoming critically important. We identify several performance anomalies of SSDs and their performance and endurance impacts on SSD employed in enterprise environment by evaluating several commercial SSDs. Our study provides insights and suggestions to both system developers and SSD vendors. Further based on the performance anomalies identified, we design an IO scheduler that takes advantage of the SSD features and evaluate its performance on SSD. The scheduler is shown to improve performance in terms of bandwidth and average response time.

Solid State Drive Functionality Matthew A. Wood, Utica College, 2013. This research demonstrated the affects that solid state drives SSDs have on computer forensic examinations. This was accomplished by first discussing the questions of how investigators can ensure data integrity if the data stored on an SSD constantly changes and discussing the functions of SSDs with respect to the potential loss of digital forensic evidence. This study also included two experiments designed to test the SSD's wear leveling and garbage collecting capabilities. The first experiment tested the wear leveling capabilities and its effects on data validation. The results displayed a different computed hash value after completing the imaging process, indicating changes to the data on the drive occurred and the data validation process failed. The second experiment tested the garbage collection function and the possibility of finding signs the test file existed on the drive. Forensic Toolkit Imager acquired two drive images of the SSD. The first image contained a test file. The image did show evidence the file existed on the drive. After deleting the first test file and saving a second test file, the forensic software acquired a second image of the drive. The results showed the first test file did not exist on the drive, indicating the garbage collector function deleted the first test file, overwrote the space where the file was saved, and saved the new test file. Keywords: Cybersecurity, solid state drives, SSD, best evidence, best practices, memory hash imaging. Professor Albert Orbinati.

On Performance Optimization and System Design of Flash Memory Based Solid State Drives in the Storage Hierarchy Feng Chen, 2010. Abstract: As an emerging storage technology, Flash Memory based Solid State Drive (SSD) has shown a high potential to fundamentally change the existing Hard Disk Drive (HDD) based storage systems. Unlike conventional magnetic disks, SSD is built on semiconductor chips and has no mechanical components, e.g., rotating disk platters. This architectural difference brings many attractive technical features such as high random data access performance and low power consumption. Most importantly, these unique features could potentially address the long-existing technical limitations of conventional magnetic disks. Due to this reason, SSD has been called a pivotal technology that may completely revolutionize current computer storage systems.

Solid-State Drives (SSD) Technology BCC Research, 2017-09 De-indirection for Flash-based Solid State Drives

,2013 Flash based solid state drives SSDs have revolutionized storage with their high performance Modern flash based SSDs virtualize their physical resources with indirection to provide the traditional block interface and hide their internal operations and structures When using a file system on top of a flash based SSD the device indirection layer becomes redundant Moreover such indirection comes with a cost both in memory space and in performance Given that flash based devices are likely to continue to grow in their sizes and in their markets we are faced with a terrific challenge How can we remove the excess indirection and its cost in flash based SSDs We propose the technique of de indirection to remove the indirection in flash based SSDs With de indirection the need for device address mappings is removed and physical addresses are stored directly in file system metadata By doing so the need for large and costly indirect tables is removed while the device still has its freedom to control block allocation decisions enabling it to execute critical tasks such as garbage collection and wear leveling In this dissertation we first discuss our efforts to build an accurate SSD emulator The emulator works as a Linux pseudo block device and can be used to run real system workloads The major challenge we found in building the SSD emulator is to accurately model SSDs with parallel planes We leveraged several techniques to reduce the computational overhead of the emulator Our evaluation results show that the emulator can accurately model important metrics for common types of SSDs which is sufficient for the evaluation of various designs in this dissertation and in SSD related research Next we present Nameless Writes a new device interface that removes the need for indirection in flash based SSDs Nameless writes allow the device to choose the location of a write only then is the client informed of the name i e address where the block now resides We demonstrate the effectiveness of nameless writes by porting the Linux ext3 file system to use an emulated nameless writing device and show that doing so both reduces space and time overheads thus making for simpler less costly and higher performance SSD based storage We then describe our efforts to implement nameless writes on real hardware Most research on flash based SSDs including our initial evaluation of nameless writes rely on simulation or emulation However nameless writes require fundamental changes in the internal workings of the device its interface to the host operating system and the host OS Without implementation in real devices it can be difficult to judge the true benefit of the nameless writes design Using the OpenSSD Jasmine board we develop a prototype of the Nameless Write SSD While the flash translation layer changes were straightforward we discovered unexpected complexities in implementing extensions to the storage interface Finally we discuss a new solution to perform de indirection the File System De Virtualizer FSDV which can dynamically remove the cost of indirection in flash based SSDs FSDV is a light weight tool that de virtualizes data by changing file system pointers to use device physical addresses Our evaluation results show that FSDV can dynamically reduce indirection mapping table space with only small performance overhead We also demonstrate that with our design of FSDV the changes needed in file system flash devices and device interface are small

FAR-tree Feng Jiang,2013 Solid state drives SSDs are becoming more common with their main advantage of faster reads compared to hard disk drives HDDs

However writes are relatively slower indeed asymmetric with respect to reads unlike in HDDs where read and write are comparable Current indexing structures were designed for HDDs and aim at reducing the number of reads at query time In SSDs index writes may impact the overall query performance in the presence of updates Thus we focus on minimizing the number of writes during index update considering the R tree in particular given that it is an ubiquitous and update expensive indexing structure We propose the FAR tree for Flash Aware R tree which aims at avoiding node splits by building a chain of nodes on leaf nodes Our experiments using real and synthetic datasets show that the FAR tree can yield a more update efficient index at the cost of some overhead at query time
