Statistics of Earth Science Data Graham J. Borradaile, 2013-11-11 The Goals of Data Collection and Its Statistical Treatment in the Earth Sciences The earth sciences are characterised by loose and complex relationships between variables and the necessity to understand the geographical distribution of observations as well as their frequency distribution Our frequency distributions and the looseness of relationships reflect the complexity and intrinsic natural variation in nature more than measurement error Furthermore earth scientists cannot design experiments according to statistical recommendation because the availability and complexity of data are beyond our control Usually the system we are studying cannot be isolated into discrete independent variables These factors influence the first steps of research how and where to collect specimens or observations Some issues are particularly troublesome and common in earth science but are rarely handled in an undergraduate statistics course These include spatial sampling methods orientation data regionalised variables time series identification of cyclicity and pattern discrimination multivariate systems lurking variables and constant sum data It is remarkable that most earth science students confront these issues without formal training or focused consideration The Virtual High School Andrew A. Zucker, Robert Kozma, 2003-01-01 This authoritative volume is the first to provide a thorough detailed account of the virtual high school Based on a 5 year study conducted by experienced researchers at SRI International it provides crucial information to assist educators and policymakers in creating adapting and learning how to effectively use these new online schools This book answers such questions as What is the difference between an online and face to face classroom What is it like to take or to teach a course online Are online courses effective What are the problems with its use **Principles of Signal Detection and Parameter Estimation** Bernard C. Levy, 2008-12-16 As a discipline signal detection has evolved significantly over the last 40 years Some changes have been caused by technical advances like the development of robust detection methods or the use of the theory of large deviations to characterize the asymptotic performance of tests but most changes have been caused by transformations in the engineering systems to which detection techniques are applied While early applications of signal detection focused on radar and sonar signal processing or the design of digital communication receivers newer areas of application include image analysis and interpretation document authentication biometrics and sensor or actuator failure detection This expanded scope of application has required some adjustment in standard ways of formulating detection problems For example image processing applications typically combine parameter estimation and detection tasks so the separation of parameter estimation and detection in distinct operations typical of early communication systems where parameter estimation was accomplished through the use of training signals needs to be abandoned Other changes have occurred in the design of communication systems which make it increasingly difficult to treat the detection of communications signals and of radar sonar signals in a unified manner This common framework assumes implicitly that intersymbol interference is not present and that channel coding and modulation are implemented separately

since in this case modulated signals can be detected one symbol at a time But modern communication systems are typically designed to operate over bandlimited channels where intersymbol interference is present and starting with the introduction of trellis coded modulation modulation and coding have become intertwined
