

Primary return water temperature (chiller entering), T_4

Primary flow (chiller flow), F_p

How does one know when to take a chiller off-line?

The traditional primary-secondary logic says to measure the flow and when primary flow exceeds secondary flow by the capacity of one primary pump, shut down a pump and chiller. In actuality, systems with low ΔT never see this condition. Shutting down a primary pump will often lead to re-circulating flow through the de-coupler.

How is bypass flow determined?

This can be done relatively simply using temperature measurements at the bypass T_5 , the return temperature T_3 , and mixed return temperature T_4 . Since the chilled-water-flow rate in the primary loop is known to be a good approximation, the flow rate through the bypass can be calculated using these temperatures. Alternatively, a flow meter in the bypass line can be used to measure the excess primary flow directly.
