## **Environmental And Hydrological Systems Modelling:**

**Environmental and Hydrological Systems Modelling** A W Jayawardena, 2014-01-21 Mathematical modelling has become an indispensable tool for engineers scientists planners decision makers and many other professionals to make predictions of future scenarios as well as real impending events As the modelling approach and the model to be used are problem specific no single model or approach can be used to solve all problems and there are constraints in each situation Modellers therefore need to have a choice when confronted with constraints such as lack of sufficient data resources expertise and time Environmental and Hydrological Systems Modelling provides the tools needed by presenting different approaches to modelling the water environment over a range of spatial and temporal scales Their applications are shown with a series of case studies taken mainly from the Asia Pacific Region Coverage includes Population dynamics Reaction kinetics Water quality systems Longitudinal dispersion Time series analysis and forecasting Artificial neural networks Fractals and chaos Dynamical systems Support vector machines Fuzzy logic systems Genetic algorithms and genetic programming This book will be of great value to advanced students professionals academics and researchers working in the water environment
