industry has long admired the aircraft industry's use of lightweight metals, advanced finishing processes, and composites. The use of these materials and processes has helped reduce overall mass and in turn improved speed, performance, and reliability of race engines. Their initial high cost was a limiting factor for integrating them into mass-produced vehicles. With racing leading the way, those limitations were overcome, and vehicles today feature some amazing adaptations of those processes and materials. Engine power, efficiency, durability, reliability, and more recently emissions have always been of primary importance to the automotive world. The expanding use of electrification, biofuels, CNG, high-pressure fuel delivery systems, combustion air management, turbocharging, supercharging, and low viscosity lubricants have been the focus of race engine development and are now turning up in dealer showrooms. The papers in this publication were selected for two reasons: they demonstrate the leadership that racing plays in the future of automotive engineering and design as it relates to engines, and they will be interesting to everyone who may be in racing and to those who may want to be in racing.
