CORE DRILLING

Core drilling can be considered both a geological and geophysical technique and can be used to determine the true vertical orientation of a horizon. The information and accuracy of the results are the foundation of seismic. Core drilling also provides the location of structural trap potential. Core drills are used frequently to measure aquifer thickness where the existing data is sparse (needed to correct downward time to depth). The two locations are determined and corrected by geophysics and geologists. In addition, geophysical logging (acoustic, resistivity, and magnetic) is used to provide information on the lithology and structure of the well. Geophysical well logging provides insight throughout completion and can be used to identify any issues.

SEISMIC

Seismic techniques have recently had a renaissance, based primarily on the growing use of 3D seismic data and the ability of geophysical processing to extract more data from existing 2D seismic. Advances in seismic imaging have improved seismic resolution and imaging of complex structures. Computer advances and the use of imaging software (beamforming) has led to the use of imaging software (beamforming) to extract more data from existing 2D seismic.
