**Introduction to Chemical Process: Fundamentals and Design** Kenneth Solen,John Harb,2005-08-10 DESCRIPTION The goal of this book is to help the student experience chemical engineering to the fullest extent possible within the constraints of limited time and limited student background In pursuit of that goal it teaches the freshman to solve quantitative problems although at a low level of complexity and within a scope that is narrow and well defined These quantitative topics include material balances reacting and non reacting systems fluid flow

including the sizing of pumps mass transfer diffusion and convection chemical reactor design heat transfer including the design of heat exchangers and engineering economics As examples of the limited scope of these topics the treatment of material balances for reacting systems is limited to single process units with one chemical reaction and the treatment of fluid flow applications is restricted to the use of the mechanical energy balance where friction is mentioned but friction factors and methods for determining friction losses are not introduced Spreadsheets are also taught and homework problems throughout the book give the students practice with this tool In addition a number of qualitative descriptions are presented in the text including chapters on problem solving engineering teamwork and process control Finally the students are given a few writing assignments to illustrate the important role of written communication in engineering

Chemical Engineering Morton Denn, 2011-09-30 Chemical engineering is the field of applied science that employs physical chemical and biological rate processes for the betterment of humanity This opening sentence of Chapter 1 has been the underlying paradigm of chemical engineering Chemical Engineering An Introduction is designed to enable the student to explore the activities in which a modern chemical engineer is involved by focusing on mass and energy balances in liquid phase processes Problems explored include the design of a feedback level controller membrane separation hemodialysis optimal design of a process with chemical reaction and separation washout in a bioreactor kinetic and mass transfer limits in a two phase reactor and the use of the membrane reactor to overcome equilibrium limits on conversion Mathematics is employed as a language at the most elementary level Professor Morton M Denn incorporates design meaningfully the design and analysis problems are realistic in format and scope
