of this research is to help the company optimize their current routings and make the decisions of 1 how to schedule the most efficient deliveries which meet delivery commitment times and satisfy all other constraints 2 after delivery whether or not should a vehicle go extra miles to pick up products from certain vendor given that allowance will be offered if the company picks up products In order to solve this Vehicle Routing Problem with Backhauls VRPB a Mixed Integer Linear Programming MILP model with the objective of minimizing total cost is developed Compared to a traditional Vehicle Routing Problem VRP additional constraints such as Precedence Constraint Working and Driving Hour Constraint and Time Window Constraint are considered With the data provided by the company the optimal set of routes are found out which generate the minimum total cost and satisfy all the constraints

Network Routing Michael O. Ball,1995-10-30 The papers in this volume consider a general area of study known as network routing The underlying problems are conceptually simple yet mathematically complex and challenging How can we best route material or people from one place to another Or how can we best design a system for instance locate facilities to provide services and goods as efficiently and equitably as possible The problems encountered in answering these questions often have an underlying combinatorial structure for example either we dispatch a vehicle or we do not or we use one particular route or another The problems also typically have an underlying network structure a communication or transportation network In addition models for these problems are often very large with hundreds or thousands of constraints and variables A companion volume in the Handbook series entitled Network Models treats basic network models such as minimum cost flows matching and the travelling salesman problem as well as several complex network topics not directly related to routing such as network design and network reliability
