Fundamentals of Resource Allocation in Wireless Networks
Slawomir Stanczak, Marcin Wiczanowski, Holger Boche, 2009-06-29 The purpose of this book is to provide tools for a better understanding of the fundamental tradeoffs and interdependencies in wireless networks with the goal of designing resource allocation strategies that exploit these interdependencies to achieve significant performance gains Two facts prompted us to write it First future wireless applications will require a fundamental understanding of the design principles and control mechanisms in wireless networks Second the complexity of the network problems simply precludes the use of engineering common sense alone to identify good solutions and so mathematics becomes the key avenue to cope with central technical problems in the design of wireless networks In this book two fields of mathematics play a central role Perron Frobenius theory for non negative matrices and optimization theory This book is a revised and expanded version of the research monograph Resource Allocation in Wireless Networks that was published as Lecture Notes in Computer Sciences LNCS 4000 in 2006 Although the general structure has remained unchanged to a large extent the book contains numerous additional results and more detailed discussion For instance there is a more extensive treatment of general nonnegative matrices and interference functions that are described by an axiomatic model Additional material on max min fairness proportional fairness utility based power control with QoS quality of service support and stochastic power control has been added
