## Introduction:

The use of mathematical modeling to predict line, equipment, and staff capacities for telephone systems is an accepted technique for fine-tuning existing systems, as well as designing new ones. Through sensitivity analysis, such predictions can also provide a comprehensive overview of a particular design.

Most available literature on traffic engineering either concentrates on obscure and complicated calculations, or alludes to formulas, but does not include them. This paper defines relevant terms, and discusses the most commonly used formulas and their applications. A knowledge of secondary school mathematics is sufficient to do the calculations in this paper.

Traffic engineering techniques are used most often to determine:

- Line and trunk quantities required for a PBX or computer
- Number of DTMF (Dual Tone Multi-frequency) registers, conference trunks, RAN (Recorded Announcement Route) trunks, etc. required
- Traffic capacity of a PBX, given the number of speech paths (simultaneous conversations) available
- Quantities, service levels, and usage of such special service trunks as foreign exchange (FX), discounted toll trunks, and tie trunks (leased lines between PBXs)
- Operator staffing levels and performance predictions as well as the impact of system change on staff quantities
- Automatic call distributor (ACD) staffing and service levels

## Terminology:

The terms used in traffic engineering are standard telecommunications usage. The following brief glossary lists those terms needed to understand the formulas presented in this paper.

*Traffic Theories for New Telecommunications Services* N. M. van Dijk,1990 Selected papers from the Specialist Seminar of the Adelaide International Teletraffic Congress are presented in this book Together they give an excellent sample of the work being done around the world to define and meet the new challenges in Teletraffic theory and practice Although many questions are answered here the papers pose many more problems which are still to be solved Many papers present methods for solving problems that will remain difficult even as computing speed increases exponentially The methods used include heuristic and AI approaches approximations simplifications new approaches to numerical analysis and simulation and some new techniques borrowed from other disciplines While some problems are hard to solve because of complexity others are difficult because of uncertainty Some forms of uncertainty may be quantified and dealt with by using probability theory many examples may be found in this volume Further papers show that stationary stochastic processes are now being challenged as other models are also tried
