treatment examples **Interdisciplinary Research in Diabetology** Ali Tootee, Bagher Larijani, Ping Wang, 2024-10-04 The prevalence of diabetes has alarmingly increased in both developed and developing countries in recent years. The prevalence of different complications and comorbid conditions associated with diabetes has also rampantly increased thereby endangering the lives of patients with diabetes. In fact, obesity which is associated with diabetes is currently a major global public health concern. Nevertheless, it can be argued that little progress has been made in the field of the management of diabetes during the past decades and many believe that the discovery of insulin was not followed by further significant advancements in the management of diabetes. Diagnostic and screening approaches to diabetes have considerably evolved in recent decades. Saccharometers are replaced by glucometers and elaborated laboratory techniques. However, there are still limitations to such technologies and they cannot be used on large scales and in pediatric endocrinology they are not well complied with. In fact, it may be argued that the progress we have made in the management of diabetes has mainly focused on the invention of more efficient insulin preparations and improved techniques for its delivery. Technologies for diabetes Maurizio Delvecchio, Giuseppina Salzano, Davide Tinti, Roque Cardona-Hernandez, 2023-06-01 **Freestyle Libre Flash Glucose Self-monitoring System** Julia Bidonde, Beate Charlotte Fagerlund, Katrine B. Frønsdal, Ulrikke Højslev Lund, Bjarne Robberstad, 2017 **BACKGROUND** Diabetes mellitus DM has become one of the most common public health problems world wide. According to the 2014 Norwegian Public Health report, diabetes affects an estimated 4.3% of the Norwegian population. Diabetes is a metabolic disorder resulting from a defect in insulin production, secretion, action, or all. Type 1 and 2 are the two main types, with the prevalence of type 2 accounting for the majority, 85% of diabetes. This assessment will focus on FreeStyle Libre flash glucose monitor for insulin treated individuals with type 1 and 2 diabetes. Type 1 and 2 DM. To achieve proper quality of life and reduce long term problems, people are increasingly encouraged to take an active role in the management of their condition. Adequate treatment management aimed at tight control of blood glucose reduces the risk of the long term complications of diabetes such as retinopathy, nephropathy, neuropathy, coronary heart disease, ischaemic stroke, and peripheral vascular disease. Management of the disease should be understood as a package including testing of blood glucose, taking insulin, i.e. multiple daily insulin injections, using an insulin pump, using anti-hyperglycemic drugs, or adopting lifestyle interventions such as diet and physical activity. In recent years, and available in Europe since 2014, the FreeStyle Libre System, a wireless method using a sensor for monitoring interstitial fluid glucose, was introduced to help individuals with type 1 and 2 DM achieve better glucose control. The system, unlike others, does not require finger prick calibration since that functionality is embedded into the core technology. Also, unlike other systems, the individual has to take active action to get access to the real time glucose value by leading the receiver over the sensor. Similarly to other continuous glucose monitoring options, it relies on the individual to take action on the information retrieved. **SUGGESTED RESEARCH PRIORITIES** 1 Independent research for FreeStyle Libre will be important. 2 Diabetes affects the life of children, adolescents, and their

caregivers in many ways as well as pregnant women Independent research including these groups is warranted 3 The clinical effectiveness of FreeStyle Libre needs to be investigated in different conditions for example among individuals with poor self monitoring adherence newly diagnosed impaired awareness of hypoglycaemia and in addition to training and education components 4 FreeStyle Libre compared to other continuous monitoring systems is warranted 5 Pain is a major determinant of diabetes treatment adherence especially for children and it should be included as an individual outcome in future trials 6 Future trials should include longer term follow up and quality of life outcome assessments at various points to inform improved clinical and cost effectiveness modelling
