Chapter 4 – Handling User input

1. Create a Web form to help in creating “Jumble” puzzles. Create a form that has four input fields named Word1, Word2, Word3, and Word4, as well as “Reset” and “Submit” buttons. Create a form processing script that verifies that all four words are entered, and that all four are between 4 and 7 characters long. Once all the words have been verified as correct, use the strtoupper() and str_shuffle() functions to produce four jumbled sets of letters. (two-part form)

- a. Create a new document in your text editor. Type the <!DOCTYPE> declaration, <html> element, header information, and <body> element.
- b. Add the following XHTML form tags in the document body:

```
<form action="chapter_04_hw_01_process.php" method="post">
Word 1: <input type="text" name="Word1" /><br />
Word 2: <input type="text" name="Word2" /><br />
Word 3: <input type="text" name="Word3" /><br />
Word 4: <input type="text" name="Word4" /><br />
<input type="reset" value="Clear Form" />&nbsp;&nbsp;&nbsp;
&nbsp;&nbsp;&nbsp;<input type="submit" name="Submit" value="Send Form" />
</form>
```

- c. Save the document as chapter_04_hw_01.html.
- d. Create a new document in your text editor. Type the <!DOCTYPE> declaration, <html> element, header information, and <body> element.
- e. Add the opening and closing tags for the PHP script section in the body of the document:

```
<?php
?>
```

- f. Add the displayError() function to the script section. This function displays the error message, and takes two parameters: \$fieldName, which is the name of the field as it appears on the Web form, and \$errorMsg, which describes the error for the user. There is no return value for this function.

```
function displayError($fieldName, $errorMsg) {
    global $errorCount;
    echo "Error for \"$fieldName\": $errorMsg<br />";
    ++$errorCount;
}
```
