S. Kesavan,2017-12 *Optimization of Small Reservoir Irrigation System for Semi-arid Tropics* Prem Niwas Sharma,1981 For centuries small reservoirs called tanks have been a traditional method of storing water in the semi arid tropics Their use is presently being expanded but as yet no design or location guidelines have been developed This study constructs an optimization procedure for both tank design and location in order to maximize net benefits Two representative traditional tank systems near Hyderabad India were monitored to collect input data for the model and gain insight into the significant design parameters The results of studying the traditional tank systems showed that their overall system water utilization efficiency was four to six times lower than the potential water utilization efficiency This inefficiency was caused by over

irrigating growing water intensive crops e g rice high evaporation and seepage losses from the tank and non optimal tank placement The optimization procedure for designing tanks utilized a modified nonlinear constrained Fletcher Powell algorithm The procedure finds the optimum storage capacity optimum dimensions and optimum location for an elevated inlet type tank shaped as an inverted truncated cone though the model can be modified to suit any definable shape of a tank The model also considers seepage and evaporation losses along with detailed construction costs which account for lead and lift in the excavation work The optimum location of the tank in the catchment is found by placing the tank in a position to maximize runoff considering irrigable area command area Whether or not one tank or several smaller tanks should be constructed is determined by comparing the unconstrained optimum size with the constrained optimum size for the catchment and choosing the minimum of the two The study concludes with a sensitivity analysis to determine the relationship between net benefits vs seepage rates and net benefits vs discount rates Most of the input data concerning soils and crop responses were from studies conducted at the International Crops Research Institute for Semi Arid tropics ICRISAT Hyderabad India

POWER PLANT ENGINEERING GUPTA, MANOJ KUMAR, 2012-06-12 This textbook has been designed for a one semester course on Power Plant Engineering studied by both degree and diploma students of mechanical and electrical engineering It effectively exposes the students to the basics of power generation involved in several energy conversion systems so that they gain comprehensive knowledge of the operation of various types of power plants in use today After a brief introduction to energy fundamentals including the environmental impacts of power generation the book acquaints the students with the working principles design and operation of five conventional power plant systems namely thermal nuclear hydroelectric diesel and gas turbine The economic factors of power generation with regard to estimation and prediction of load plant design plant operation tariffs and so on are discussed and illustrated with the help of several solved numerical problems The generation of electric power using renewable energy sources such as solar wind biomass geothermal tidal fuel cells magneto hydrodynamic thermoelectric and thermionic systems is discussed elaborately The book is interspersed with solved problems for a sound understanding of the various aspects of power plant engineering The chapter end questions are intended to provide the students with a thorough reinforcement of the concepts discussed
