

Theory and Practice of Artificial Intelligence

Abstract

If you don't understand artificial intelligence, ask yourself if I am right because others don't understand it either.

There is no generally applicable definition of artificial intelligence.

The field is so vast that its actors will always have to develop a more precise definition of their own objectives in their context.

Artificial intelligence is broadly defined as the simulation of human intelligence by machines programmed to learn, reason, and solve problems.

Therefore, AI encompasses several subfields, including machine learning (ML), deep learning (DL), robots, natural language processing (NLP), and computer vision, etc., each with distinct applications and limitations.

And yet, AI can be classified into two main categories:

i- Narrowly defined AI (concrete definition of AI)

Which is simply defined as an automated algorithm operating on the basis of statistical transition matrices, which allows it to increase the amount of existing information.

ii- General AI (broad definition of AI):

such as machine learning (ML), deep AI (DAI), image and voice recognition, etc.
