

# Characterization of Polymers Using TGA

W.J. Sichina, Marketing Manager

## Introduction

Thermogravimetric analysis (TGA) is one of the members of the family of thermal analysis techniques used to characterize a wide variety of materials. TGA provides complementary and supplementary characterization information to the most commonly used thermal technique, DSC.

TGA measures the amount and rate (velocity) of change in the mass of a sample as a function of temperature or time in a controlled atmosphere. The measurements are used primarily to determine the thermal and/or oxidative stabilities of materials as well as their compositional properties. The technique can analyze materials that exhibit either mass loss or gain due to decomposition, oxidation or loss of volatiles (such as moisture). It is especially useful for the study of polymeric materials, including thermoplastics, thermosets, elastomers, composites, films, fibers, coatings and paints.

TGA measurements provide valuable information that can be used to select materials for certain end-use applications, predict product performance and improve product quality. The technique is particularly useful for the following types of measurements:

- Compositional analysis of multi-component materials or blends
- Thermal stabilities
- Oxidative stabilities
- Estimation of product lifetimes
- Decomposition kinetics
- Effects of reactive atmospheres on materials
- Filler content of materials
- Moisture and volatiles content

PerkinElmer offers a variety of high performance TGA instruments encompassing a wide range of application needs and operational requirements. All of the TGA instruments feature an optional, state-of-the-art autosampler for reliable, unattended operation.

The extended capabilities of the PerkinElmer TGA, as a valuable tool for polymeric characterization and quality assurance are demonstrated by these applications.

## Thermal Stabilities and Moisture Content

Figure 1 shows the TGA results generated on nylon 6,6 toothbrush bristles. The plot shows the percent mass as a function of sample temperature for the nylon 6,6 bristles under a nitrogen purge. Approximately 10 mg of sample was heated at a rate of 30 C/min with the PerkinElmer TGA.

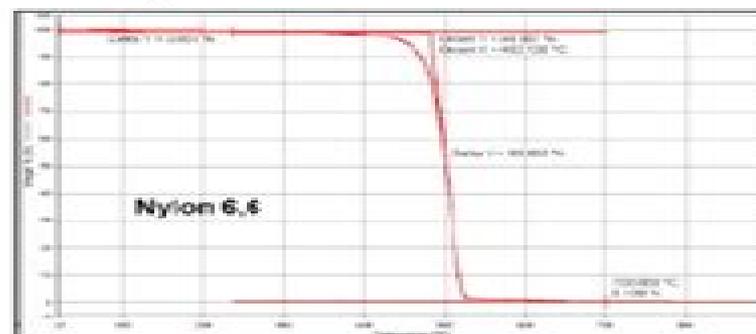

Figure 1. TGA results obtained for nylon 6,6 bristles showing thermal degradation.

Polymer Characterization by Thermal Methods of Analysis Jen Chiu, 1974 1st published in Journal of Macromolecular Science Chemistry V A8 no 1 1974 **Polymer Characterization by Thermal Methods of Analysis** Jen Chiu, 1974

Polymer Characterization Interdisciplinary Approaches Clara D. Craver, 2012-12-06 Physical and spectroscopic methods have been used jointly for characterization of polymers for at least four decades Yet new techniques permit increasingly refined determination of polymer chemistry and morphology The correlation of this knowledge with physical properties of polymers is helpful to planned synthesis of new products The most prominent spectroscopic techniques through the forties and fifties were infrared and ultraviolet spectroscopy Nuclear magnetic resonance electron spin resonance and Mossbauer spectroscopy started making significant contributions to polymer chemistry in the early sixties Still more recently fluorescence spectroscopy and laser Raman spectroscopy have become readily applicable to polymers and are contributing significantly to the understanding of the relationship between polymer structure and properties Determination of the distribution of monomer sequences by molecular size has become possible through combined gel permeation chromatography and spectroscopic analysis Fragments of polymers from chemical break down or from pyrolysis are further fractionated and structurally analyzed The relationship between the chemistry of polymers and performance can be determined from changes in chemical structure and orientation after curing degradation or physical or thermal manipulation of the polymers Characterisation of Polymers by Thermal Analysis W.M. Groenewoud, 2001-05-21 Thermal Analysis TA has become an indispensable family of analytical techniques in the polymer research The increased importance of these techniques can be seen as the result of three more or less parallel developments a tempestuous development of TA measuring techniques in combination with a high degree of automation the strongly increased understanding of the underlying theory and the increasing knowledge of the relation between the polymers chemical structure and their physical properties These areas are still in their developmental stages especially the third area The increasing knowledge of the dependence of physical properties on chemical structure just accentuated more and more the need for accurate

thermoanalytical measurements and this knowledge is very important for the first stages of the development of new polymeric systems Besides the contribution of TA remains necessary for the technical and commercial development of such a new polymer system The use of the various TA techniques in these processes is described in this book in nine chapters while chapter ten illustrates the information obtained about different polymers during special case studies This book illustrates in this way applications of a wide variety of TA techniques whilst it is written from a materials characterisation rather than from a TA point of view with attention being paid to the chemical structure physical properties correlations

**Thermal Characterization of Polymeric Materials** Edith Turi,2012-12-02 Thermal Characterization of Polymeric Materials is a critical review and a concise evaluation of the application of thermal analysis in polymer science and engineering This book is divided into nine chapters that specifically tackle the instrumentation theory and a wide variety of applications of thermal characterization The introductory chapters provide an overview of all aspects of thermal analytical methods and apparatus and the theory underlying the basic principles of thermal analysis These chapters also examine the theories and functions of state for thermometry dilatometry thermomechanical analysis calorimetry thermogravimetry These topics are followed by a discussion on single component and multicomponent systems and their phase transitions as influenced by concentration pressure deformation molecular weight and copolymerization The subsequent chapters explore the influence of important chemical and physical parameters on the glass transition crystallization and melting of thermoplastic materials The discussion then shifts to the theoretical aspects of polymer polymer compatibility phase separation and miscibility in mixed polymer systems This book further considers the thermal analysis in thermosets elastomers and fibers The concluding chapters present the methods of obtaining information on the relative flammability properties of polymers for screening fire retardant additives and for studying the mechanism of flame inhibition These chapters also look into the thermal analysis of antioxidants stabilizers lubricants plasticizers impact modifiers and fire retardants Polymer scientists and researchers will find this book invaluable
