

CLRS Exercise Solutions- Greedy Algorithms

An activity-selection problem

15.1-1

Give a dynamic-programming algorithm for the activity-selection problem, based on recurrence (15.2). Have your algorithm compute the sizes $c[i, j]$ as defined above and also produce the maximum-size subset of mutually compatible activities.

Assume that the inputs have been sorted as in equation (15.1). Compare the running time of your solution to the running time of GREEDY-ACTIVITY-SELECTOR.

The given algorithm would just stupidly compute the minimum of the $O(n)$ numbers or return zero depending on the size of S_{ij} . There are a possible number of subproblems that is $O(n^2)$ since we are selecting i and j so that $1 \leq i \leq j \leq n$. So, the runtime would be $O(n^3)$.

15.1-2

Suppose that instead of always selecting the first activity to finish, you instead select the last activity to start that is compatible with all previously selected activities. Describe how this approach is a greedy algorithm, and prove that it yields an optimal solution.

This becomes exactly the same as the original problem if we imagine time running in reverse, so it produces an optimal solution for essentially the same reasons. It is greedy because we make the best looking choice at each step.

15.1-3

Not just any greedy approach to the activity-selection problem produces a maximum-size set of mutually compatible activities. Give an example to show that the approach of selecting the activity of least duration from among those that are compatible with previously selected activities does not work. Do the same for the approaches of always selecting the compatible activity that overlaps the fewest other remaining activities and always selecting the compatible remaining activity with the earliest start time.

Introduction to Algorithms Leiserson Cormen (Rivest),1990

Introduction to Algorithms & Data Structures, 1 Bolakale Aremu,2025-01-07 What You Will Learn How to Get Help The design of an efficient algorithm for the solution of the problem calls for the inclusion of appropriate data structures In the field of computer science data structures are used to store and organize data in a way that is easy to understand and use They are used to organize and represent data in a way that will make it easier for computers to retrieve and analyze it These are the fundamental building blocks that any programmer must know how to use correctly in order to build their own programs Benefits of learning about algorithms and data structures First they will help you become a better programmer Another benefit is that they will make you think more logically Furthermore they can help you design better systems for storing and processing data They also serve as a tool for optimization and problem solving As a result the concepts of algorithms and data structures are very valuable in any field For example you can use them when building a web app or writing software for other devices You can apply them to machine learning and data analytics which are two hot areas right now If you are a hacker algorithms and data structures in Python are also important for you everywhere Now whatever your preferred learning style I ve got you covered If you re a visual learner you ll love my clear diagrams and illustrations throughout this book If you re a practical learner you ll love my hands on lessons so that you can get practical with

Algorithmics for Hard Problems Juraj Hromkovič, 2013-03-14

Algorithmic design especially for hard problems is more essential for success in solving them than any standard improvement of current computer technologies Because of this the design of algorithms for solving hard problems is the core of current algorithmic research from the theoretical point of view as well as from the practical point of view There are many general textbooks on algorithmics and several specialized books devoted to particular approaches such as local search randomization approximation algorithms or heuristics But there is no textbook that focuses on the design of algorithms for hard computing tasks and that systematically explains combines and compares the main possibilities for attacking hard algorithmic problems As this topic is fundamental for computer science this book tries to close this gap Another motivation and probably the main reason for writing this book is connected to education The considered area has developed very dynamically in recent years and the research on this topic discovered several profound results new concepts and new methods Some of the achieved contributions are so fundamental that one can speak about paradigms which should be included in the education of every computer science student Unfortunately this is very far from reality This is because these paradigms are not sufficiently known in the computer science community and so they are insufficiently communicated to students and practitioners

Problems on Algorithms Habib Izadkhah, 2022 With approximately 2500 problems this book provides a collection of practical problems on the basic and advanced data structures design and analysis of algorithms To make this book suitable for self instruction about one third of the algorithms are supported by solutions and some others are supported by hints and comments This book is intended for students wishing to deepen their knowledge of algorithm design in an undergraduate or beginning graduate class on algorithms for those teaching courses in this area for use by practicing programmers who wish to hone and expand their skills and as a self study text for graduate students who are preparing for the qualifying examination on algorithms for a Ph D program in Computer Science or Computer Engineering About all it is a good source for exam problems for those who teach algorithms and data structure The format of each chapter is just a little bit of instruction followed by lots of problems This book is intended to augment the problem sets found in any standard algorithms textbook This book begins with four chapters on background material that most algorithms instructors would like their students to have mastered before setting foot in an algorithms class The introductory chapters include mathematical induction complexity notations recurrence relations and basic algorithm analysis methods provides many problems on basic and advanced data structures including basic data structures arrays stack queue and linked list hash tree search and sorting

algorithms provides many problems on algorithm design techniques divide and conquer dynamic programming greedy algorithms graph algorithms and backtracking algorithms is rounded out with a chapter on NP completeness

Algorithms
M. H. Alsuwaiyel, 2021-11 Problem solving is an essential part of every scientific discipline It has two components 1 problem identification and formulation and 2 the solution to the formulated problem One can solve a problem on its own using ad hoc techniques or by following techniques that have produced efficient solutions to similar problems This required the understanding of various algorithm design techniques how and when to use them to formulate solutions and the context appropriate for each of them This book presents a design thinking approach to problem solving in computing by first using algorithmic analysis to study the specifications of the problem before mapping the problem on to data structures then on to the suitable algorithms Each technique or strategy is covered in its own chapter supported by numerous examples of problems and their algorithms The new edition includes a comprehensive chapter on parallel algorithms and many enhancements
