

# A systematic review of observational practice for adaptation of reaching movements

Julian Rudisch<sup>1</sup> <sup>✉</sup>, Luis K. H. Holzhauer<sup>1,2</sup>, Karmen Kravanja<sup>3</sup>, Fred H. Hamker<sup>4</sup> & Claudia Voelcker-Rehage<sup>1</sup>

Observational practice is discussed as a substitute for physical practice for motor learning and adaptation. We systematically reviewed the literature on observational practice in reaching and aiming tasks. Our objectives were to identify (i) performance differences between observational and physical practice; (ii) factors that contribute to adaptation following observational practice; and (iii) the neural correlates of observational practice. We found 18 studies, all investigated adaptation of reaching in visuomotor rotations or force-field perturbations. Results of the studies showed that observational practice led to adaptation in both, visuomotor rotation and force-field paradigms ( $d' = -2.16$  as compared to no practice). However, direct effects were considerably smaller as compared to physical practice ( $d' = 4.38$ ) and aftereffects were absent, suggesting that observational practice informed inverse, but not forward modes. Contrarily, neurophysiological evidence in this review showed that observational and physical practice involved similar brain regions.

Motor learning—as it is defined in this paper—encompasses the acquisition of new unknown skills or tasks as well as the improvement or adaptation of skills acquired in the past. While movement skills are typically learned through repeated task execution (i.e., physical practice), observation of a model or another actor executing the task (i.e., observational practice), can have beneficial effects for the acquisition of new skills and adaptation of previously learned skills. Some evidence exists about the benefits, modalities, and potential underlying brain mechanisms when learning motor skills from observational practice (i.e., observational learning) in upper extremity tasks, such as reaching<sup>1</sup>. Reaching, aiming, and grasping are involved in many (instrumental) activities of daily living and frequently targeted following motor impairments such as stroke. Further, reaching plays a prominent role in the interaction with technical devices and human-like robots (or robotic arms) might learn reaching actions in a similar fashion to humans. Observational practice can supplement or enhance the learning of reaching skills through physical practice<sup>2</sup>. In the context of sports sciences research, observational learning of more complex upper extremity skills, such as juggling, or a tennis serve has been intensively investigated in the past<sup>3</sup>. However, to date, no systematic review of the literature on observational learning of relatively simple reaching, aiming, and grasping tasks that are relevant for activities of daily living has been conducted. In this study, we

therefore systematically reviewed studies on observational practice in reaching, aiming, and grasping tasks. Our aim was to investigate whether observational practice of upper extremity reaching movements leads to similar learning rates and involves similar neural (brain) mechanisms as compared to physical practice and whether there are factors that determine learning success.

It has been well established that we do not only learn and adapt motor skills through physical, but also through mental practice. This includes the imagination of oneself performing the action (i.e., motor imagery) as well as the observation of another person (i.e., action observation) performing the same action. The potential of learning from observing a demonstrator (i.e., observational practice) as a substitute or complementary mode of practice is discussed to be particularly useful in situations where novel complex movements are learned, e.g., for sports or playing musical instruments<sup>4</sup>, when movement execution is restricted, e.g., in rehabilitation<sup>5</sup> or when unskilled practice may have severe consequences and prior development of expertise is crucial, e.g., when performing surgery<sup>6</sup>. Whether learning from observing others can complement or even replace physical practice depends on different factors, such as the complexity of the task, the current skill level as well as its attentional and motivational state of the learner<sup>7</sup>.

Adaptive Spatial Alignment Gordon M. Redding, Benjamin Wallace, 2013-06-17 For most people prism adaptation is an amusing demonstration first experienced perhaps in an introductory psychology course This monograph relates this peculiar phenomenon to the larger context of cognitive science especially motor control and learning The first part sketches the background concepts necessary to understand the contribution of prism adaptation to the larger issue of adaptive perceptual motor performance including a review of the basic concepts of motor control and learning that enable strategic response in the prism adaptation situation the development of a hypothesis about spatial representation and spatial mapping and an introduction to the basic idea of adaptive spatial alignment and a contrasting view of perceptual and motor learning and a review of evidence for the involvement of nonassociative and associative learning in prism adaptation Directly concerned with data and theory in prism adaptation the second part presents an outline of prism adaptation methodology and a list of several empirical conclusions from previous research that constrained development of theoretical framework a theory of strategic perceptual motor control and learning which enables adaptive performance during prism exposure but does not directly involve adaptive spatial alignment an extension of the theory to include realignment processes which correct for the spatial misalignment among sensorimotor systems produced by prisms and a demonstration of how traditional issues in prism adaptation may be rephrased in terms of the present theoretical framework The last part of this volume reviews the research conducted in developing and testing the present theory of prism adaptation It summarizes the initial investigations employing a naturalistic exposure setting reports some more rigorous tests with an experimentally constrained research paradigm points out the more general theoretical issues raised by the authors analysis of prism adaptation and makes specific suggestions for further research within the prism adaptation paradigm Public Health Service Publication, 1971
