**K Nearest Neighbor Algorithm** Fouad Sabry,2023-06-23 What Is K Nearest Neighbor Algorithm The k nearest neighbors technique also known as k NN is a non parametric supervised learning method that was initially created in 1951 by Evelyn Fix and Joseph Hodges in the field of statistics Thomas Cover later expanded on the original concept It has applications in both regression and classification In both scenarios the input is made up of the k training instances in a data collection that are the closest to one another Whether or not k NN was used for classification or regression the results are as follows The output of a k nearest neighbor classification is a class membership A plurality of an item s neighbors votes on how the object should be classified and the object is then assigned to the class that is most popular among its k nearest neighbors where k is a positive number that is often quite small If k is equal to one then the object is simply classified as belonging to the category of its single closest neighbor The result of a k NN regression is the value of a certain property associated with an object This value is the average of the values of the k neighbors that are the closest to the current location If k is equal to one then the value of the output is simply taken from the value of the one nearest neighbor
