Abstract: This paper provides a comprehensive and systematic review of fault localization methods based on artificial intelligence (AI) in power distribution networks described in the literature. The review is organized into several sections that cover different aspects of the methods proposed. It first discusses the advantages and disadvantages of various techniques used, including neural networks, fuzzy logic, and reinforcement learning. The paper then compares the types of input and output data generated by these algorithms. The review also analyzes the data-gathering systems, including the sensors and measurement equipment used to collect data for fault diagnosis. In addition, it discusses fault type and DG considerations, which, together with the data-gathering systems, determine the applicability range of the methods. Finally, the paper concludes with a discussion of future trends and research gaps in the field of AI-based fault location methods. Highlighting the advantages, limitations, and requirements of current AI-based methods, this review can serve the researchers working in the field of fault location in power systems to select the most appropriate method based on their distribution system and requirements, and to identify the key areas for future research.

1. Introduction

Following to a short-circuit fault in distribution networks, the fault should be located and isolated before restoring the supply. A fast and accurate fault location method can help to improve the continuity of supply considerably. In general, the distribution-network fault location methods can be categorized into impedance-based methods, state estimation-based methods, traveling wave-based methods, and artificial intelligence-based (AI-based) methods.

The impedance-based methods determine the location of faults by measuring the apparent impedance seen from one or more measurement points. These methods estimate the fault location by comparing the measured impedance for the probable fault paths in the network with the measured one [1–5]. These methods can provide fault location estimations with acceptable accuracy, although they might estimate several candidate locations in the networks with several laterals. They require detailed data about the network topology, line impedances, and loads and are, hence, very sensitive to network-model inaccuracies.

State estimation-based methods consider a fault as bad data and try to locate it using the data collected from different measurement points of the network [6–8]. Similar to the impedance-based methods, these techniques need the distribution-network data. While they are less sensitive to input data inaccuracies, they can only be applied to networks with considerable measurement infrastructures.

Traveling wave-based methods estimate the fault location by calculating the sweep duration of the wave traveling from the measurement point to the fault location [9–12].

Analysis techniques of diagnosis high voltage underground cables Hussain Mahdi,2016-10-24 Thesis M A from the year 2015 in the subject Electrotechnology grade Warsaw University of Technology Electrical Engineering language English abstract This study is focused on installations and faults diagnosis of high voltage underground cables and examined on the various ways through which they can be identified and corrected It has been found that wear and tear is one of the major issues leading to electric faults like power loss There has been seen that several causes of failure which could be identified with them and analyze better ways of detecting them So it has been looked at how to detect degradation of insulation of the underground cable After a thorough analysis of fault detection techniques have been explained the pre location fault techniques is described I illustrated many methods which aid to discover the fault location I also developed a method which contributes in pre location of the fault based on Matlab simulation and mathematical slope equation This method was invented after the observation that the voltages measured at the local and remote substations after filtering and after Fourier analysis showed a linear behavior that was proportional to the respective distances between the fault location and the mentioned substations or generators Thus the developed method exploits such a linearity to estimate the fault location by interpolation assuming that the parameters of the line are previously known and that dedicated devices are located on site in both substations to provide post fault measurements of the faulted line Finally I clarify many pin pointing methods to precisely determine the fault location
