Part A: RNA Structure

Besides ensuring the exact replication of chromosomes, the order of the bases is a genetic code of instructions for the cell. How does the cell "read" the chemical message coded in its DNA?

Part of the answer lies with a second molecule present in cells called **ribonucleic acid (RNA)**. RNA is similar to DNA in that it is made of nucleotides. However, there is no deoxyribose or thymine in RNA. Deoxyribose is replaced by **ribose** in RNA, and thymine is replaced by **uracil**. If you look at their structural formulas and models, you will see that ribose and uracil are similar to the molecules they replace.

1. Which base is replaced by uracil in RNA?

_____ *thymine* _____

2. What molecule replaces deoxyribose in RNA?

_____ *ribose* _____

3. To which base in DNA do the following RNA bases pair?

Guanine _____ *cytosine* _____

Adenine _____ *uracil* _____

Cytosine _____ *guanine* _____

Uracil _____ *adenine* _____

Part B: RNA Transcription

Open (unzip) one of your DNA models between the base pairs and separate the two halves. Using the *left side* of your DNA model as a pattern, match up the proper RNA nucleotides with the DNA nucleotides. You have made a *messenger RNA* molecule.

4. Do the RNA half-rung bases pair exactly as they would if this were DNA replication? not exactly

Remove the RNA nucleotide series from the DNA pattern. Close the DNA molecule back up with its original right side. DNA molecules "unzip" temporarily during **RNA transcription** and then zip closed again.

mRNA is a single-stranded molecule. Thus, the sequence of RNA nucleotides formed from DNA represents a complete mRNA molecule. After its formation, this mRNA leaves the nucleus and goes to where the ribosomes are. It carries the DNA message of base sequences in the exact same order out of the nucleus and into the cytoplasm.

On this table compare DNA and RNA, check all that apply:

	DNA	mRNA
Deoxyribonucleic Acid		
Ribonucleic Acid		
Contains the sugar deoxyribose		
Contains sugar ribose		
Contains a phosphate group		
Contains adenine		
Contains thymine		
Contains uracil		
Contains guanine		
Contains cytosine		
Monomers are nucleotides		
Double-strand molecule		
Single-strand molecule		
Leaves/moves out of the nucleus		
Contains a chemical code

Microbial Symbiosis of Marine Sessile Hosts - Diversity, Function and Applications Suhelen Egan, Torsten Thomas, 2015-12-21 Modern molecular omics tools: metagenomics, metaproteomics, etc. have greatly contributed to the rapid advancement of our understanding of microbial diversity and function in the world's oceans. These tools are now increasingly applied to host associated environments to describe the symbiotic microbiome and obtain a holistic view of marine host microbial interactions. Whilst all eukaryotic hosts are likely to benefit from their microbial associates, marine sessile eukaryotes including macroalgae, seagrasses, and various invertebrates (sponges, acidians, corals, hydroids, etc.) rely in particular on the function of their microbiome. For example, marine sessile eukaryotes are under constant grazing, colonization, and fouling pressure from the millions of micro and macroorganisms in the surrounding seawater. Host associated microorganisms have been shown to produce secondary metabolites as defense molecules against unwanted colonization or pathogens, thus having an important function in host health and survival. Similarly, microbial symbionts of sessile eukaryotes are often essential players in local nutrient cycling, thus benefiting both the host and the surrounding ecosystem. Various research fields have contributed to generating knowledge of host associated systems, including microbiology, biotechnology, molecular biology, ecology, evolution, and biotechnology. Through a focus on model marine sessile host systems, we believe that new insight into

the interactions between host and microbial symbionts will be obtained and important areas of future research will be identified This research topic includes original research review and opinion articles that bring together the knowledge from different aspects of biology and highlight advances in our understanding of the diversity and function of the microbiomes on marine sessile hosts
