Artificial Intelligence for Computer Games Pedro Antonio González-Calero, Marco Antonio Gómez-Martín, 2011-03-01 The book presents some of the most relevant results from academia in the area of Artificial Intelligence for games It emphasizes well theoretically supported work

supported by developed prototypes which should lead into integration of academic AI techniques into current electronic entertainment games The book elaborates on the main results produced in Academia within the last 10 years regarding all aspects of Artificial Intelligence for games including pathfinding decision making and learning A general theme of the book is the coverage of techniques for facilitating the construction of flexible not prescribed AI for agents in games Regarding pathfinding the book includes new techniques for implementing real time search methods that improve the results obtained through AI as well as techniques for learning pathfinding behavior by observing actual players Regarding decision making the book describes new techniques for authoring tools that facilitate the construction by game designers typically nonprogrammers of behavior controlling software by reusing patterns or actual cases of past behavior Additionally the book will cover a number of approaches proposed for extending the essentially pre scripted nature of current commercial videogames AI into a more interactive form of narrative where the story emerges from the interaction with the player Some of those approaches rely on a layered architecture for the character AI including beliefs intentions and emotions taking ideas from research on agent systems The book also includes chapters on techniques for automatically or semiautomatically learning complex behavior from recorded traces of human or automatic players using different combinations of reinforcement learning case based reasoning neural networks and genetic algorithms

that the syntax was also influenced by a number of other languages these included CLU C SNOBOL and AWK The developers of Lua had stated in one of the articles that was published in Dr Dobb s Journal that the decision to use tables as the primary data structure for Lua has been influenced by LISP and Scheme This is because these languages had lists as their data structure mechanism which is single and global in nature Scheme has had increasing influence on the semantics of Lua with the passage of time This influence can be evidently seen with the inclusion of full lexical scoping and anonymous functions in the language The release of versions of Lua up till version 5 0 was made under a license that was similar to the BSD license Afterwards MIT license was used to make releases This was applicable from the release of version 5 0
