

The background of the cover features several stylized neurons. Each neuron has a central cell body (soma) and multiple thin, radiating processes (dendrites and axons). The cell bodies are a light blue or grey color, while the processes are a darker blue. At the ends of many of these processes, there are small, glowing yellow-orange spots, which likely represent synapses or active zones. The neurons are scattered across the cover, with a larger cluster in the bottom left and a few individual ones in the top right and bottom right.

Fahrbach, 2013 This textbook offers a concise introduction to the exciting field of developmental neuroscience a discipline concerned with the mechanisms by which complex nervous systems emerge during embryonic growth Bridging the divide between basic and clinical research it captures the extraordinary progress that has been achieved in the field It provides an opportunity for students to apply and extend what they have learned in their introductory biology courses while also directing them to the primary literature This accessible textbook is unique in that it takes an in depth look at a small number of The Cambridge Encyclopedia of Child Development Brian Hopkins, Elena Geangu, Sally Linkenauger, 2017-10-19 Updated and expanded to 124 entries The Cambridge Encyclopedia of Child Development remains the authoritative reference in the field Development of the Nervous System Dan H. Sanes, Thomas A. Reh, William A. Harris, Matthias Landgraf, 2019-06-13 Development of the Nervous System Fourth Edition provides an informative and up to date account of our present understanding of the basic principles of neural development as exemplified by key experiments and observations from past and recent times This book reflects the advances made over the last few years demonstrating their promise for both therapy and molecular understanding of one of the most complex processes in animal development This information is critical for neuroscientists developmental biologists educators and students at various stages of their career providing a clear presentation of the frontiers of this exciting and medically important area of developmental biology The book includes a basic introduction to the relevant aspects of neural development covering all the major topics that form the basis of a comprehensive advanced undergraduate and graduate curriculum including the patterning and growth of the nervous system neuronal determination axonal navigation and targeting neuron survival and death synapse formation and plasticity Provides broad coverage of concepts and experimental strategies Includes full color schematics and photographs of critical experiments Outlines the molecular and genetic basis for most developmental events Written at a level that is appropriate for advanced undergraduates and beyond Includes designs of critical experiments that are easy to understand Zero to Birth William A. Harris, 2024-01-09 Professor W A Harris takes readers on an extraordinary journey to the very edge of creation from the moment of an egg s fertilization through each step of a human brain s development in the womb Provided by publisher Representing Development David Marco Carre, Jaan Valsiner, Stefan Hampl, 2016-07-15 Representing Development presents the different social representations that have formed the idea of development in Western thinking over the past three centuries Offering an acute perspective on the current state of developmental science and providing constructive insights into future pathways the book draws together twelve contributors with a variety of multidisciplinary and international perspectives to focus upon development in fields including biology psychology and sociology Chapters and commentaries in this volume present a variety of perspectives surrounding social representation and development addressing their contemporary enactments and reflecting on future theoretical and

empirical directions The first section of the book provides an historical account of early representations of development that having come from life science has shaped the way in which developmental science has approached development Section two focuses upon the contemporary issues of developmental psychology neuroscience and developmental science at large The final section offers a series of commentaries pointing to the questions opened by the previous chapters looking to outline the future lines of developmental thinking This book will be of particular interest to child psychologists educational psychologists and sociologists or historians of science as well as academics and students interested in developmental and life sciences

Research ,2009 **Developmental Cognitive Neuroscience: An Introduction** Mark Johnson,1997-01-01 Developmental cognitive neuroscience is concerned with the relation between the growing brain and the development of mental processes Bringing together recent advances in molecular biology neural networks and brain imaging this interdisciplinary field is rapidly expanding and offers a cohesive account of the construction of the human mind This book is the first comprehensive single authored introduction to the field and reviews the current state of knowledge in the context of an integrative theoretical framework within which the plasticity and maturation of the brain are analysed A central theme of the book is that while there is no evidence of innate cognitive representations in the cortex the type and location of representation that subsequently emerge are constrained by several factors both intrinsic and extrinsic to the infant Further the elongated postnatal development of the human brain reveals a differential development of neural architecture that can be used to make predictions about sequences of cognitive development The book also outlines a number of avenues for future research
