Bio Design Nature Science Creativity:

Bio Design William Myers, 2014 Bio Design examines some seventy projects concepts prototypes and completed designs that cover the fields of architecture industrial processes education fine art material engineering and bioengineering Each project is illustrated by a short text images and captions that combine to explain the problems the venture tackles and how living materials and processes were harnessed to solve them in sustainable and aesthetically pleasing ways Designers and artists have always looked to nature for inspiration and materials but only recently have they been able to alter and incorporate living organisms in their work In a world with finite resources and a growing population design that mimics or appropriates the sustainable template of nature is likely to prove as vital as it is novel Many of the solutions also provoke thought about manipulating life for human ends From bacteria that can spin microfibrils of pure cellulose for use in the clothing industry to pigeons that fed special bacteria excrete harmless detergent instead of faeces and from lamps that require blood to function to genetically hacked plants with human DNA biological design is science future here and now

Toward a Living Architecture? Christina Cogdell, 2019-01-01 A bold and unprecedented look at a cutting edge movement in architecture Toward a Living Architecture is the first book length critique of the emerging field of generative architecture and its nexus with computation

biology and complexity Starting from the assertion that we should take generative architects rhetoric of biology and sustainability seriously Christina Cogdell examines their claims from the standpoints of the sciences they draw on complex systems theory evolutionary theory genetics and epigenetics and synthetic biology She reveals significant disconnects while also pointing to approaches and projects with significant potential for further development Arguing that architectural design today often only masquerades as sustainable Cogdell demonstrates how the language of some cutting edge practitioners and educators can mislead students and clients into thinking they are getting something biological when they are not In a narrative that moves from the computational toward the biological and from current practice to visionary futures Cogdell uses life cycle analysis as a baseline for parsing the material energetic and pollution differences between different digital and biological design and construction approaches Contrary to green tech sustainability advocates she questions whether quartzite based silicon technologies and their reliance on rare earth metals as currently designed are sustainable for much longer challenging common projections of a computationally designed and manufactured future Moreover in critiquing contemporary architecture and science from a historical vantage point she reveals the similarities between eugenic design of the 1930s and the aims of some generative architects and engineering synthetic biologists today Each chapter addresses a current architectural school or program while also exploring a distinct aspect of the corresponding scientific language theory or practice No other book critiques generative architecture by evaluating its scientific rhetoric and disjunction from actual scientific theory and practice Based on the author s years of field research in architecture studios and biological labs this rare field building book does no less than definitively unsparingly explain the role of the natural sciences within contemporary architecture
