Advanced PHP Programming George Schlossnagle,2004-02-20 This is the eBook version of the printed book If the print book includes a CD ROM this content is not included within the eBook version Over the past three years PHP has evolved from being a niche language used to add dynamic functionality to small sites to a powerful tool making strong inroads into large scale business critical Web systems The rapid maturation of PHP has created a skeptical population of users from more traditional enterprise languages who question the readiness and ability of PHP to scale as well as a large population of PHP developers without formal computer science backgrounds who have learned through the hands on experimentation while developing small and midsize applications in PHP While there are many books on learning PHP and developing small applications with it there is a serious lack of information on scaling PHP for large scale business critical systems Schlossnagle s Advanced PHP Programming fills that void demonstrating that PHP is ready for enterprise Web

applications by showing the reader how to develop PHP based applications for maximum performance stability and extensibility

JMS provides a common interface to standard messaging protocols and to special messaging services in support of Java programs. The messages exchange crucial data between computers rather than between users information such as event notification and service requests. Messaging is often used to coordinate programs in dissimilar systems or written in different programming languages. Using the JMS interface a programmer can invoke the messaging services of IBM's MQSeries Progress Software's SonicMQ and other popular messaging product vendors. In addition JMS supports messages that contain serialized Java objects and messages that contain Extensible Markup Language XML pages. Messaging is a powerful new paradigm that makes it easier to uncouple different parts of an enterprise application. Messaging clients work by sending messages to a message server.

which is responsible for delivering the messages to their destination Message delivery is asynchronous meaning that the client can continue working without waiting for the message to be delivered The contents of the message can be anything from a simple text string to a serialized Java object or an XML document Java Message Service shows how to build applications using the point to point and publish and subscribe models how to use features like transactions and durable subscriptions to make an application reliable and how to use messaging within Enterprise JavaBeans It also introduces a new EJB type the MessageDrivenBean that is part of EJB 2.0 and discusses integration of messaging into J2EE
