Hybrid Systems: Computation and Control Nancy Lynch,Bruce Krogh,2007-10-28 This book constitutes the refereed proceedings of the Third International Workshop on Hybrid Systems Computation and Control HSCC 2000 held in Pittsburgh PA USA in March 2000 The 32 revised full papers presented together with abstracts of four invited talks were carefully reviewed and selected from a total of 71 papers submitted The focus of the works presented is on modeling control synthesis design and verification of hybrid systems Among the application areas covered are control of electromechanical systems air traffic control control of automated freeways and chemical process control Self-similar and Self-affine Sets and Measures

Balázs Bárány,Károly Simon,Boris Solomyak,2023-11-16 Although there is no precise definition of a fractal it is usually understood to be a set whose smaller parts when magnified resemble the whole Self similar and self affine sets are those for which this resemblance is precise and given by a contracting similitude or affine transformation The present book is devoted to this most basic class of fractal objects The book contains both introductory material for beginners and more advanced topics which continue to be the focus of active research Among the latter are self similar sets and measures with overlaps including the much studied infinite Bernoulli convolutions Self affine systems pose additional challenges their study is often based on ergodic theory and dynamical systems methods In the last twenty years there have been many breakthroughs in these fields and our aim is to give introduction to some of them often in the simplest nontrivial cases The book is intended for a wide audience of mathematicians interested in fractal geometry including students Parts of the book can be used for graduate and even advanced undergraduate courses **Probability** Richard Durrett,1996 Modern and measure theory

Functions and Random Oracles Arno Mittelbach, Marc Fischlin, 2021-01-19 Hash functions are the cryptographer's Swiss Army knife. Even though they play an integral part in today's cryptography, existing textbooks discuss hash functions only in passing and instead often put an emphasis on other primitives like encryption schemes. In this book, the authors take a different approach and place hash functions at the center. The result is not only an introduction to the theory of hash functions and the random oracle model but a comprehensive introduction to modern cryptography. After motivating their unique approach in the first chapter, the authors introduce the concepts from computability theory, probability theory, information theory, complexity theory, and information theoretic security that are required to understand the book's content. In Part I, they introduce the foundations of hash functions and modern cryptography. They cover a number of schemes, concepts, and proof techniques, including computational security, one-way functions, pseudorandomness, and pseudorandom functions, game-based proofs, message authentication codes, encryption schemes, signature schemes, and collision-resistant hash functions. In Part II, the authors explain the random oracle model, proof techniques used with random oracles, random oracle constructions, and examples of real-world random oracle schemes. They also address the limitations of random oracles and the random oracle controversy, the fact that uninstantiable schemes exist which are provably secure in the random oracle model but which become insecure with any real-world hash function. Finally, in Part III, the authors focus on constructions of hash functions. This includes a treatment of iterative hash functions and generic attacks against hash functions, constructions of hash functions based on block ciphers and number-theoretic assumptions, a discussion of privately keyed hash functions, including a full security proof for HMAC and a presentation of real-world hash functions. The text is supported with exercises, notes, references, and pointers to further reading, and it is a suitable textbook for undergraduate and graduate students and researchers of cryptology and information security. *American Book Publishing Record*, 2004. Balakrishnan, Noam Elkies, Brendan Hassett, Bjorn Poonen, Andrew V. Sutherland, John Voight, 2022-03-15 This volume contains articles related to the work of the Simons Collaboration Arithmetic Geometry Number Theory and Computation. The papers present mathematical results and algorithms necessary for the development of large-scale databases like the L-functions and Modular Forms Database LMFDB. The authors aim to develop systematic tools for analyzing Diophantine properties of curves, surfaces, and abelian varieties over number fields and finite fields. The articles also explore examples important for future research. Specific topics include algebraic varieties over finite fields, the Chabauty-Coleman method, modular forms, rational points on curves of small genus, unit equations, and integral points. *Proceedings of the 36th Annual ACM Symposium on the Theory of Computing*, 2004.
