*Video Processing in the Cloud* Rafael Silva Pereira, Karin K. Breitman, 2011-08-22 As computer systems evolve the volume of data to be processed increases significantly either as a consequence of the expanding amount of available information or due to the possibility of performing highly complex operations that were not feasible in the past Nevertheless tasks that depend on the manipulation of large amounts of information are still performed at large computational cost i e either the processing time will be large or they will require intensive use of computer resources In this scenario the efficient use of available computational resources is paramount and creates a demand for systems that can optimize the use of resources in relation to the amount of data to be processed This problem becomes increasingly critical when the volume of information to be processed is variable i e there is a seasonal variation of demand Such demand variations are caused by a variety of factors such as an unanticipated burst of client requests a time critical simulation or high volumes of simultaneous video uploads e g as a consequence of a public contest In these cases there are moments when the demand is very low resources are almost idle while conversely at other moments the processing demand exceeds the resources capacity Moreover from an economical perspective seasonal demands do not justify a massive investment in infrastructure just to provide enough computing power for peak situations In this light the ability to build adaptive systems capable of using on demand resources provided by Cloud Computing infrastructures is very
