

Difference between serial and parallel processing

This slide shows the comparison between serial and parallel processing based on factors such as cost, processor heat, time to complete a task, data transfer rate, and so on. In serial processing, there is only one CPU to complete a task, whereas parallel processing comprises multiple CPUs.

- Same tasks are performed simultaneously in serial processing, whereas completion times might differ in parallel processing
- Data transfers in bit by bit form in serial processing, whereas data transfers in byte form, i.e., in 8 bits form in parallel processing
- Burden on the single-core CPU is substantial during sequential processing, and the processor warms up rapidly
- In comparison to serial processors, parallel processors are more expensive

Programming Massively Parallel Processors A Hands on Approach shows both student and professional alike the basic concepts of parallel programming and GPU architecture Various techniques for constructing parallel programs are explored in detail Case studies demonstrate the development process which begins with computational thinking and ends with effective and efficient parallel programs Topics of performance floating point format parallel patterns and dynamic parallelism are covered in depth For this new edition the authors are updating their coverage of CUDA including the concept of unified memory and expanding content in areas such as threads while still retaining its concise intuitive practical approach based on years of road testing in the authors own parallel computing courses Teaches computational thinking and problem solving techniques that facilitate high performance parallel computing Updated to utilize CUDA version 10 0 NVIDIA s software development tool created specifically for massively parallel environments Features new content on unified memory as well as expanded content on threads streams warp divergence and OpenMP Includes updated and new case studies Parallel Processing for Scientific Computing Michael A. Heroux,Padma Raghavan,Horst D. Simon,2006-01-01 Scientific computing has often been called the third approach to scientific discovery emerging as a peer to experimentation and theory Historically the synergy between experimentation and theory has been well understood experiments give insight into possible theories theories inspire experiments experiments reinforce or invalidate theories and so on As scientific computing has evolved to produce results that meet or exceed the quality of experimental and theoretical results it has become indispensable Parallel processing has been an enabling technology in scientific computing for more than 20 years This book is the first in depth discussion of parallel computing in 10 years it reflects the mix of topics that mathematicians computer scientists and computational scientists focus on to make parallel processing effective for scientific problems Presently the impact of parallel processing on scientific computing varies greatly across disciplines but it plays a vital role in most problem domains and is absolutely essential in many of them *Parallel Processing for Scientific Computing* is divided into four parts The first concerns performance modeling analysis and optimization the second focuses on parallel algorithms and software for an array of problems common to many modeling and simulation applications the third emphasizes tools and environments that can ease and enhance the process of application development and the fourth provides a sampling of applications that require parallel

computing for scaling to solve larger and realistic models that can advance science and engineering This edited volume serves as an up to date reference for researchers and application developers on the state of the art in scientific computing It also serves as an excellent overview and introduction especially for graduate and senior level undergraduate students interested in computational modeling and simulation and related computer science and applied mathematics aspects

A Hierarchical, Partitionable, Knowledge Based Parallel Processing System Nikitas A. Alexandridis, George Washington University. Institute for Information Science and Technology, 1989

Parallel Processing and Parallel Algorithms Seyed H Roosta, 2012-10-21

Motivation It is now possible to build powerful single processor and multiprocessor systems and use them efficiently for data processing which has seen an explosive expansion in many areas of computer science and engineering One approach to meeting the performance requirements of the applications has been to utilize the most powerful single processor system that is available When such a system does not provide the performance requirements pipelined and parallel processing structures can be employed The concept of parallel processing is a departure from sequential processing In sequential computation one processor is involved and performs one operation at a time On the other hand in parallel computation several processors cooperate to solve a problem which reduces computing time because several operations can be carried out simultaneously Using several processors that work together on a given computation illustrates a new paradigm in computer problem solving which is completely different from sequential processing From the practical point of view this provides sufficient justification to investigate the concept of parallel processing and related issues such as parallel algorithms Parallel processing involves utilizing several factors such as parallel architectures parallel algorithms parallel programming languages and performance analysis which are strongly interrelated In general four steps are involved in performing a computational problem in parallel The first step is to understand the nature of computations in the specific application domain
