Computer Architecture John L. Hennessy, David A. Patterson, 2002-05-29. This best-selling title, considered for over a decade to be essential reading for every serious student and practitioner of computer design, has been updated throughout to address the most important trends facing computer designers today. In this edition, the authors bring their trademark method of quantitative analysis not only to high-performance desktop machine design but also to the design of embedded and server systems. They have illustrated their principles with designs from all three of these domains, including examples from consumer electronics, multimedia, and web technologies, and high-performance computing. The book retains its highly rated features: Fallacies and Pitfalls, which share the hard-won lessons of real designers; Historical Perspectives, which provide a deeper look at computer design history; Putting it All Together, which present a design example that illustrates the principles of the chapter; Worked Examples, which challenge the reader to apply the concepts, theories, and methods in smaller-scale problems; and Cross-Cutting Issues, which show how the ideas covered in one chapter interact with those presented in others. In addition, a new feature, Another View, presents brief design examples in one of the three domains other than the one chosen for Putting It All Together. The authors present a new organization of the material, as well as reducing the overlap with their other text, *Computer Organization and Design: A Hardware/Software Approach*, 2e, and offering more in-depth treatment of advanced topics in multithreading, instruction-level parallelism, VLIW architectures, memory hierarchies, storage devices, and network technologies. Also new to this edition is the adoption of the MIPS 64 as the instruction set architecture. In addition to several online appendixes, two new appendixes will be printed in

the book one contains a complete review of the basic concepts of pipelining the other provides solutions a selection of the exercises Both will be invaluable to the student or professional learning on her own or in the classroom Hennessy and Patterson continue to focus on fundamental techniques for designing real machines and for maximizing their cost performance Presents state of the art design examples including IA 64 architecture and its first implementation the Itanium Pipeline designs for Pentium III and Pentium IV The cluster that runs the Google search engine EMC storage systems and their performance Sony Playstation 2 Infiniband a new storage area and system area network SunFire 6800 multiprocessor server and its processor the UltraSPARC III Trimedia TM32 media processor and the Transmeta Crusoe processor Examines quantitative performance analysis in the commercial server market and the embedded market as well as the traditional desktop market Updates all the examples and figures with the most recent benchmarks such as SPEC 2000 Expands coverage of instruction sets to include descriptions of digital signal processors media processors and multimedia extensions to desktop processors Analyzes capacity cost and performance of disks over two decades Surveys the role of clusters in scientific computing and commercial computing Presents a survey taxonomy and the benchmarks of errors and failures in computer systems Presents detailed descriptions of the design of storage systems and of clusters Surveys memory hierarchies in modern microprocessors and the key parameters of modern disks Presents a glossary of networking terms
