Concurrent Programming Gregory R. Andrews, 1991 *Mathematics of Computing Parallelism* **Concurrent Programming**, 1988 *Concurrent programming principles and practices* G. Andrews, 198? Intelligent Agents VII. Agent Theories Architectures and Languages Cristiano Castelfranchi, Yves Lesperance, 2001-07-20 Intelligent agents are one of the most important developments in computer science of the past decade Agents are of interest in many important application areas ranging from human computer interaction to industrial process control The ATAL workshop series aims to bring together researchers interested in the core micro aspects of agent technology Specifically ATAL addresses issues such as theories of agency software architectures for intelligent agents methodologies and programming languages for realizing agents and software tools for applying and evaluating agent systems One of the strengths of the ATAL workshop series is its emphasis on the synergies between theories languages architectures infrastructures methodologies and formal methods This year's workshop continued the ATAL trend of attracting a large number of high quality submissions In more detail 71 papers were submitted to the ATAL 2000 workshop from 21 countries After stringent reviewing 22 papers were accepted for publication and appear in these proceedings As with previous workshops in the series we chose to emphasize what we perceive as important new themes in agent research This year's themes were both associated with the fact that the technology of intelligent agents and multi agent systems is beginning to migrate from research labs to software engineering centers As agents are deployed in applications such as electronic commerce and start to take over responsibilities for their human users techniques for controlling their autonomy become crucial As well the availability of tools that facilitate the design and implementation of agent systems becomes an important factor in how rapidly the technology will achieve widespread use

Teaching Formal Methods C. Neville Dean, Raymond T. Boute, 2004-11-17 This book constitutes the refereed proceedings of the CoLogNet FME Symposium on Teaching Formal Methods TFM 2004 held in Ghent Belgium in November 2004 The 15 revised full papers presented together with an invited paper and 2 abstracts of invited talks were carefully reviewed and selected from numerous submissions The papers presented explore the failures and successes of formal methods education consider how the failures might be resolved evaluate how to learn from the successes and attempt promoting cooperative projects to further the teaching and learning and the usage and acceptance of formal methods

Patterns for Parallel Software Design Jorge Luis Ortega-Arjona, 2010-06-15 Essential reading to understand patterns for parallel programming Software patterns have revolutionized the way we think about how software is designed built and documented and the design of parallel software requires you to consider other particular design aspects and special skills From clusters to supercomputers success heavily depends on the design skills of software developers *Patterns for Parallel Software Design* presents a pattern oriented software architecture approach to parallel software design This approach is not a design method in the classic sense but a new way of managing and exploiting existing design knowledge for

designing parallel programs Moreover such approaches enhance not only build time properties of parallel systems but also and particularly their run time properties Features known solutions in concurrent and distributed programming applied to the development of parallel programs Provides architectural patterns that describe how to divide an algorithm and or data to find a suitable partition and link it with a programming structure that allows for such a division Presents an architectural point of view and explains the development of parallel software Patterns for Parallel Software Design will give you the skills you need to develop parallel software

Concurrent and Real-time Programming Manuel I. Capel, 2025-09-25 This textbook provides a comprehensive exploration of the principles of concurrent programming focusing on both theoretical foundations and practical implementation techniques Its content ranges from basic concepts such as thread creation and process management to more advanced topics such as inter process communication synchronization mechanisms and memory management It includes discussions on monitors MPI RMI rendezvous and rate monotonic analysis providing both foundational knowledge and practical solutions The book is divided into four chapters each building on fundamental aspects of concurrent and parallel programming Chapter 1 introduces concurrent programming by explaining key concepts such as processes as independent execution units that perform tasks concurrently concurrency models using techniques like mutual exclusion and synchronization primitives and process creation through methods like fork join and POSIX threads Next chapter 2 explores key process synchronization mechanisms in concurrent programming focusing on both mutual exclusion problems and the use of monitors as a high level solution for managing shared resources Chapter 3 then focuses on message passing systems as a fundamental approach for communication and synchronization in distributed systems where processes cannot share memory and provides models like CSP and technologies like RMI to facilitate structured reliable communication between processes Eventually chapter 4 dives into the scheduling mechanisms of real time systems focusing on how tasks are prioritized and scheduled to meet strict timing constraints with algorithms to address priority inversion while considering sporadic and aperiodic tasks This book is designed to be used as a textbook for undergraduate and graduate courses in concurrent programming operating systems and distributed systems Its well structured layout comprehensive case studies numerous exercises and illustrating real world examples make it an ideal teaching resource

Modern Multithreading Richard H. Carver, Kuo-Chung Tai, 2005-11-28 Master the essentials of concurrent programming including testing and debugging This textbook examines languages and libraries for multithreaded programming Readers learn how to create threads in Java and C and develop essential concurrent programming and problem solving skills Moreover the textbook sets itself apart from other comparable works by helping readers to become proficient in key testing and debugging techniques Among the topics covered readers are introduced to the relevant aspects of Java the POSIX Pthreads library and the Windows Win32 Applications Programming Interface The authors have developed and fine tuned this book through the concurrent programming courses they have taught for the past twenty years The material which emphasizes practical tools

and techniques to solve concurrent programming problems include original results from the authors research Chapters include Introduction to concurrent programming The critical section problem Semaphores and locks Monitors Message passing Message passing in distributed programs Testing and debugging concurrent programs As an aid to both students and instructors class libraries have been implemented to provide working examples of all the material that is covered These libraries and the testing techniques they support can be used to assess student written programs Each chapter includes exercises that build skills in program writing and help ensure that readers have mastered the chapter s key concepts The source code for all the listings in the text and for the synchronization libraries is also provided as well as startup files and test cases for the exercises This textbook is designed for upper level undergraduates and graduate students in computer science With its abundance of practical material and inclusion of working code coupled with an emphasis on testing and debugging it is also a highly useful reference for practicing programmers

Models, Algorithms, Logics and Tools Luca Aceto, Giorgio Bacci, Giovanni Bacci, Anna Ingólfssdóttir, Axel Legay, Radu Mardare, 2017-08-17 This Festschrift is published in honor of Kim Guldstrand Larsen one of the earliest precursors of computer science in Denmark on the occasion of his 60th birthday During the last three decades Kim Guldstrand Larsen has given major contributions across a remarkably wide range of topics including real time concurrent and probabilistic models of computation logic in computer science and model checking Since 1995 he has been one of the prime movers behind the model checking tool for real time systems UPPAAL for which he was a co recipient of the CAV Award in 2013 The Festschrift contains 32 papers that feature the broad range of Kim Guldstrand Larsen s research topics such as formal languages and automata theory logic verification model checking and testing algorithmic game theory and mechanism design semantics and reasoning real time and distributed systems and modeling and simulation

Thinking Programs Wolfgang Schreiner, 2025-08-29 This book describes some

basic principles that allow developers of computer programs computer scientists software engineers programmers to clearly think about the artifacts they deal with in their daily work data types programming languages programs written in these languages that compute wanted outputs from given inputs and programs that describe continuously executing systems The core message is that clear thinking about programs can be expressed in a single universal language the formal language of logic Apart from its universal elegance and expressiveness this logical approach to the formal modeling of and reasoning about computer programs has another advantage due to advances in computational logic automated theorem proving satisfiability solving model checking nowadays much of this process can be supported by software This book therefore accompanies its theoretical elaborations by practical demonstrations of various systems and tools that are based on or make use of the presented logical underpinnings
