# *The Neuropsychological Evaluation*

Diane B. Howieson, Ph.D.  
Muriel D. Lezak, Ph.D.

NEUROPSYCHOLOGICAL EVALUATIONS have been used since the 1940s for the diagnosis of acquired or congenital problems presumed to be a result of brain disease or trauma (Hebb 1942; Teuber 1948). The neuropsychologist assesses brain function inferred from an individual's cognitive, sensory, motor, emotional, or social behavior. During the early history of neuropsychology, these assessments were often the most direct measure of brain integrity in persons without localizing neurological signs and symptoms and with problems confined to higher mental functions. Neuropsychological measures still are useful diagnostic indicators of brain dysfunction for many conditions and will remain the major diagnostic modality for some (Eisenberg and Levin 1989; Jernigan and Hesselink 1987; Mapov 1988). However, diagnosis of brain damage has become increasingly accurate in recent decades as a result of improved visualization of brain structure by computed tomography (CT), magnetic resonance imaging (MRI), and angiography (Theodore 1988). These developments have allowed a shift in the

focus of neuropsychological assessment from the diagnosis of possible brain damage to a better understanding of specific brain-behavior relationships and of the psychosocial consequences of brain damage.

### □ WHEN A NEUROPSYCHOLOGICAL EVALUATION IS INDICATED

Patients referred to a neuropsychologist for assessment may be classified into one of three groups. The first and probably largest group consists of patients with known brain damage. The more common brain disorders are cerebrovascular disorders, head injury, hydrocephalus, Alzheimer's disease, Parkinson's disease, multiple sclerosis, Huntington's chorea, tumors, seizures, and infections. A neuropsychological evaluation can be useful in defining the nature and severity of resulting functional problems. The assessment provides information about the patient's cognition, personality characteristics,
