Design and Implementation of a Database Programming Language for XML-based Applications Henrike Schuhart,2006 This publication focuses on two main aspects the seamless integration of XML and persistency concepts into the object oriented programming language Java XML is the de facto standard data exchange format between arbitrary applications There have been many efforts to integrate XML into programming languages reaching from the simple document object model DOM to whole XML class generators These approaches are available in most popular programming languages The integration of persistency into programming languages has been done by database programming languages as well as by certain new popular frameworks like Hibernate or approaches like EJB Nevertheless these approaches suffer from certain limitations concerning in particular transparency and object orientation While existing database programming languages integrate the relational model Hibernate and EJB 3 x does not support polymorphism in

general EJB 2.x does not even support inheritance. In addition, although they try to, the approaches except by some database programming languages are not transparent. In this work, transparency means that arbitrary types may become persistent. Moreover, algorithms remain unchanged whether they are executed on transient or persistent objects. Finally, users can work with persistency on a very high level. Since there are so many currently developed frameworks trying to solve the integration problem of XML and persistency into object-oriented programming languages, the need for a holistic and transparent object-oriented database programming language seems to be there. The starting point of XOBEDBPL, which stands for XML Objects Database Programming Language, is the predecessor project XOBE. XOBE concentrates on the integration of XML objects and XPath as the query language for these objects. The most important feature of XOBE is that each XML operation is statically type-checked against the declared XML schema. In XOBEDBPL, the XML integration is extended regarding the manipulation of XML objects. Before XML objects could only be queried but not updated. The static type-checking idea is kept and enhanced to include updates. While XOBE's intentions lie on the development of web applications, all objects can remain transient. XOBEDBPL is supposed to deal with persistent objects as well.

Oracle Database Programming using Java and Web Services Kuassi Mensah, 2011-04-08 The traditional division of labor between the database, which only stores and manages SQL and XML data for fast, easy data search and retrieval, and the application server, which runs application or business logic and presentation logic, is obsolete. Although the book's primary focus is on programming the Oracle Database, the concepts and techniques provided apply to most RDBMS that support Java, including Oracle, DB2, Sybase, MySQL, and PostgreSQL. This is the first book to cover new Java JDBC, SQLJ, JPublisher, and Web Services features in Oracle Database 10g Release 2; the coverage starts with Oracle 9i Release 2. This book is a must-read for database developers, audience DBAs, database applications developers, data architects, Java developers, JDBC, SQLJ, J2EE, and OR Mapping frameworks, and to the emerging Web Services assemblers. Describes pragmatic solutions, advanced database applications, as well as provision of a wealth of code samples. Addresses programming models which run within the database, as well as programming models which run in middle tier or client tier against the database. Discusses languages for stored procedures: when to use proprietary languages such as PL/SQL and when to use standard languages such as Java, also running non-Java scripting languages in the database. Describes the Java runtime in the Oracle database 10g, i.e. OracleJVM, its architecture, memory management, security management, threading, Java execution, the Native Compiler, i.e. NCOMP, how to

make Java known to SQL and PL SQL data types mapping how to call out to external Web components EJB components ERP frameworks and external databases Describes JDBC programming and the new Oracle JDBC 10g features its advanced connection services pooling failover load balancing and the fast database event notification mechanism for clustered databases RAC in Grid environments Describes SQLJ programming and the latest Oracle SQLJ 10g features contrasting it with JDBC Describes the latest Database Web services features Web services concepts and Services Oriented Architecture SOA for DBA the database as Web services provider and the database as Web services consumer Abridged coverage of JPublisher 10g a versatile complement to JDBC SQLJ and Database Web Services
