

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the sliding, the rotation of the shafts in a bearing to allow movement. These consist of 2 gaskets which distribute axial forces in a gasket with an application on all shafts and shaft components used to secure the gasket. A gasket is used to maintain the pressure in a system and to prevent leakage throughout the life cycle application. The gasket compresses the two components between the mating surfaces of the system. This is done by creating a radial force to compress the gasket against the two components between the mating surfaces. If the gasket creates radial force for axial and rotational through the life of the application then would be secured the system.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a correct seal. Every gasket application or design has many requirements therefore that must be addressed by specifying the performance of what the gasket is required to do against the application.
