Andrea Cuadros Casta,2015 Android rooting enables device owners to freely customize their own devices and run useful apps that require root privileges While useful rooting weakens the security of Android devices and opens the door for malware to obtain privileged access easily Thus several rooting prevention mechanisms have been introduced by vendors and sensitive or high value mobile apps perform rooting detection to mitigate potential security exposures on rooted devices However there is a lack of understanding whether existing rooting prevention and detection methods are effective To fill this knowledge gap we studied existing Android rooting methods and performed manual and dynamic analysis on 182 selected

apps in order to identify current rooting detection methods and evaluate their effectiveness Our results suggest that these methods are ineffective We conclude that reliable methods for detecting rooting must come from integrity protected kernels or trusted execution environments which are difficult to bypass
