Gilliam,Pro-Ed (Firm),1995 GARS is used for the assessment of individuals ages 3 through 22 having behavioral problems and is designed to help professionals diagnose autism **Exploratory Factor Analysis of the Gilliam Autism Rating Scale - Second Edition with a Sample of Students with Autism Spectrum Disorders** Elissa H. Dua,2014 The Gilliam Autism Rating Scale Second Edition GARS 2 Gilliam 2006 is a widely used screening tool that assists in the identification and diagnosis of autism spectrum disorders ASDs Although this assessment measure is commonly used during autism assessments there has been little research on its psychometric properties The purpose of this study was to examine the factor structure internal consistency and screening sensitivity of GARS 2 ratings completed by special education teaching staff for a sample of students N 216 with autism spectrum disorders The exploratory factor analysis supported the retention of three factors labeled Stereotyped and Repetitive Behaviors Social Avoidance and Withdrawal and Atypical Language and Communication These three factors were very similar to those found in prior research by Lecavalier 2005 on the original GARS and Volker et al under review using the GARS 2 with a more mixed developmental disabilities sample In the present study internal consistency estimates met or exceeded standards for screening and were generally higher than those in previous studies Using an Autism Index cut score of 85 yielded a screening sensitivity of 5879 while a cut score of 90 yielded a sensitivity of 4537 These sensitivity results were generally similar to those of prior studies involving the GARS or GARS 2 It is noteworthy that the three factor solution retained in the present study matches very closely with those from two prior studies with different samples i e Lecavalier 2005 Volker et al under review suggesting the presence of a robust three factor structure However this factor structure was different from the four factor structure found by Pandolfi Magyar and Dill 2010 using the GARS 2 standardization sample Although this study provides some psychometric support for the use of the GARS 2 as a screening tool the sensitivity

estimates for the Autism Index suggest that the instrument results in a high percentage of false negative results for ASD. This significantly limits the GARS 2's utility and along with the factor analytic results suggests the need to substantially revise the instrument. Implications for instrument revision and future research are provided.

Factor Analyses and Clinical Discriminant Validity of the Gilliam Autism Rating Scale - 3rd Edition (gars-3) Using Special Education Staff Ratings in Samples with Autism Spectrum Disorder and Other Developmental Disabilities Nicole Bergamo Isbell, 2022

Based on Center for Disease Control and Prevention CDC surveillance reports the prevalence of autism spectrum disorder ASD continues to increase Maenner et al 2021. As such assessment tools that are efficient, cost effective, and psychometrically sound are key to effective screening, accurate diagnosis, and clarification of intervention needs. Kuriakose, Zwaigenbaum, Gilliam 2013. A substantial revision from earlier editions is a rating scale used to gather information from parents, caregivers, or teachers for screening or as part of a more comprehensive ASD assessment. Across editions the GARS is considered a popular assessment tool among school psychologists (e.g., Aiello et al 2017, Benson et al 2019). However, despite the strong psychometric characteristics reported in the test manuals with standardization samples, prior editions were criticized for their screening performance in independent research samples and factor analyses suggested problems with the test author's proposed subscales (e.g., Lecavalier 2005, Pandolfi et al 2010, South et al 2002, Volker et al 2016, Volker et al 2022). To date, there has been little to no research focused on the psychometric properties of the current version of the GARS beyond what is reported in the test manual. Of critical importance, there have been no published independent factor analyses conducted in ASD or broader developmental disability samples and no independent estimates of screening effectiveness or clinical discriminant validity of the GARS 3. Therefore, the present project seeks to add to the limited research regarding the GARS 3 using program evaluation data from a large special education agency in Western New York state. The project consisted of three different studies that addressed aspects of GARS 3 internal structure validity and clinical discriminant validity. Study one involved an exploratory factor analysis (EFA) of the GARS 3 items with an ASD sample (n = 204) rated by special education teaching staff. Study two confirmatory factor analyses (CFA) using a second ASD and non-ASD developmental disabilities (DDs) sample (n = 200) were used to examine the model fit of the published GARS 3 model and the factor model derived from the study one EFA and assess which of the two models better fit the sample covariance matrix. Finally, aspects of the GARS 3's clinical discriminant validity were assessed using unique ASD cases from studies one and two (ASD sample n = 226) and an additional non-ASD developmental disabilities sample (non-ASD DDs sample n = 64) from the same special education agency. Clinical discriminant validity was examined via between-group comparisons, classification accuracy of a predetermined cut score, and exploration of other possible cut scores using receiver operator characteristic (ROC) curve analyses. The EFA resulted in a six-factor solution that was very similar in structure to the GARS 3 published six-factor model, differing only in the placement of one item. The CFAs indicated that the GARS 3 published model and the EFA derived model both fit the data well and did not

substantively differ. However, when cross loadings were added based on EFA results, CFA model fit significantly improved. ROC curve analyses indicated that when using the suggested cut score of 70, sensitivity and specificity were lower than predicted. Lower cut scores yielded good sensitivity but poorer specificity, while higher cut scores showed the opposite pattern. Discussion and recommendations pertained to examining items and subscales based on cross loadings and inter-factor correlations in addition to clinical implications of sensitivity and specificity findings.

Gilliam Autism Rating Scale
James E. Gilliam, 1996* *The Gilliam Autism Rating Scale* James E. Gilliam, 1995. Cet instrument de mesure est utilisé auprès de personnes autistes âgées entre 3 et 22 ans et qui rencontrent des problèmes de comportements importants. Le but de cet instrument est d'aider les professionnels à poser un diagnostic d'autisme et il peut être compilé par quiconque a des contacts directs et continus avec un individu enseignant, parents intervenants ou personnes significatives. Il se base sur la définition de l'autisme donnée par l'Autism Society of America que l'on retrouve dans le Diagnostic and Statistical Manual of Mental Disorders Fourth Edition (DSM-IV) de l'American Psychiatric Association et donne des informations sur l'autisme et les critères de diagnostic.
