**Introduction to Probability** Dimitri Bertsekas, John N. Tsitsiklis, 2008-07-01 An intuitive yet precise introduction to probability theory stochastic processes statistical inference and probabilistic models used in science engineering economics and related fields This is the currently used textbook for an introductory probability course at the Massachusetts Institute of Technology attended by a large number of undergraduate and graduate students and for a leading online class on the subject The book covers the fundamentals of probability theory probabilistic models discrete and continuous random variables multiple random variables and limit theorems which are typically part of a first course on the subject It also contains a number of more advanced topics including transforms sums of random variables a fairly detailed introduction to Bernoulli Poisson and Markov processes Bayesian inference and an introduction to classical statistics The book strikes a balance between simplicity in exposition and sophistication in analytical reasoning Some of the more mathematically rigorous analysis is explained intuitively in the main text and then developed in detail at the level of advanced calculus in the numerous solved theoretical problems

**Advanced Metaheuristics: Novel Approaches for Complex Problem Solving** Erik Cuevas, Nahum Aguirre, Oscar Barba-Toscano, Mario Vásquez-Franco, 2025-05-17 This book examines a series of strategies designed to enhance metaheuristic algorithms focusing on critical aspects such as initialization methods the incorporation of Evolutionary Game Theory to develop novel search mechanisms and the application of learning concepts to refine evolutionary operators Furthermore it emphasizes the significance of diversity and opposition in preventing premature convergence and improving algorithmic efficiency These strategies collectively contribute to the development of more adaptive and robust optimization techniques The book was designed from a teaching standpoint making it suitable for undergraduate and postgraduate students in Science Electrical Engineering or Computational Mathematics Furthermore engineering practitioners unfamiliar with metaheuristic computations will find value in the application of these techniques to address complex real world engineering problems extending beyond theoretical constructs

**Abstract Dynamic Programming** Dimitri Bertsekas, 2022-01-01 This is the 3rd edition of a research monograph providing a synthesis of old research on the foundations of dynamic programming DP with the modern theory of approximate DP and new research on semicontractive models It aims at a unified and economical development of the core theory and algorithms of total cost sequential decision problems based on the strong connections of the subject with fixed point theory The analysis focuses on the abstract mapping that underlies DP and defines the mathematical character of the associated problem The discussion centers on two fundamental properties that this mapping may have monotonicity and weighted sup norm contraction It turns out that the nature of the analytical and algorithmic DP theory is determined primarily by the presence or absence of these two properties and the rest of the problem's structure is largely inconsequential New research is focused on two areas 1 The ramifications of these properties in the context of algorithms for approximate DP and 2 The new class of semicontractive

models exemplified by stochastic shortest path problems where some but not all policies are contractive The 3rd edition is very similar to the 2nd edition except for the addition of a new chapter Chapter 5 which deals with abstract DP models for sequential minimax problems and zero sum games The book is an excellent supplement to several of our books Neuro Dynamic Programming Athena Scientific 1996 Dynamic Programming and Optimal Control Athena Scientific 2017 Reinforcement Learning and Optimal Control Athena Scientific 2019 and Rollout Policy Iteration and Distributed Reinforcement Learning Athena Scientific 2020 **Wiley Encyclopedia of Telecommunications, 5 Volume Set** John G. *Design and Analysis of Learning Classifier Systems* Jan Drugowitsch, 2008-06-17 This book is probably best summarized as providing a principled foundation for Learning Classifier Systems Something is happening in LCS and particularly XCS and its variants that clearly often produces good results Jan Drugowitsch wishes to understand this from a broader machine learning perspective and thereby perhaps to improve the systems His approach centers on choosing a statistical definition derived from machine learning of a good set of classifiers based on a model according to which such a set represents the data For an illustration of this approach he designs the model to be close to XCS and tests it by evolving a set of classifiers using that definition as a fitness criterion seeing if the set provides a good solution to two different function approximation problems It appears to mean that in some sense his definition of good set of classifiers also in his terms a good model structure captures the essence in machine learning terms of what XCS is doing In the process of designing the model the author describes its components and their training in clear detail and links it to currently used LCS giving rise to recommendations for how those LCS can directly gain from the design of the model and its probabilistic formulation The seeming complexity of evaluating the quality of a set of classifiers is alleviated by giving an algorithmic description of how to do it which is carried out via a simple Pittsburgh style LCS
