

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the sliding, the rotation of the ends of a shaft to allow movement. These consist of a gasket and a dynamic seal. They are a gasket with an application on all shafts and shaft connections used to secure the shaft. A gasket is used to maintain the pressure or vacuum seal of a pipe or a flange throughout the life cycle application. The gasket compresses to the shape of the mating surfaces to form a seal. This is done by creating a contact force to compress the gasket against the mating surfaces between the mating surfaces. If the gasket creates resistance to the pressure and movement through the life of the application then it would be considered a gasket.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a certain seal. Every gasket application or design has many requirements therefore they must be addressed by specifying the performance of what the gasket is required to do against the application.
