

# The Rectilinear Motion

**Rectilinear motion** is a physics concept that describes the displacement of an object in a straight line, without a change in direction.

In this type of motion, the trajectory is a straight line, and the velocity can be either constant or variable. Parameters such as position, velocity, and acceleration are studied as functions of time.

Understanding **rectilinear motion** is essential for grasping basic principles of kinematics. It is applied in classical mechanics to simplify the description of movements in experimental settings or practical applications, providing a foundational understanding of motion in a linear context.

**Cause and Explanation in Ancient Greek Thought** R. J. Hankinson, 1998-12-03 R J Hankinson traces the history of ancient Greek thinking about causation and explanation from its earliest beginnings around 600 BC through to the middle of the first millennium of the Christian era The ancient Greeks were the first Western civilization to subject the ideas of cause and explanation to rigorous and detailed analysis and to attempt to construct theories about them on the basis of logic and experience Hankinson examines the ways in which they dealt with questions about how and why things happen as and when they do about the basic constitution and structure of things about function and purpose laws of nature chance coincidence and responsibility Such diverse questions are unified by the fact that they are all demands for an account of the world that will render it amenable to prediction and control they are therefore at the root of both philosophical and scientific enquiry Hankinson draws on a wide range of original sources in philosophy natural sciences medicine history and the law in order to create a synoptic picture of the growth and development of these central concepts in the Graeco Roman world **PHYSICS**
